I understand how to create a .dvi file using Postscript fonts, i.e. I do something like documentstyle[times]... and the Times font is used in my document. I also understand that when using dvips to produce a .ps file that the Times font is used. My question is, are converted Postscript fonts available so that the .dvi files can be previewed on the screen and printed as .dvi files? Thanks for any light you can shed on this!

>Land, Inc.

I'm not sure about the PeripheralLand drives, but I have a NeXT and, though I haven't pokes around it much, it does have a standard SCSI interface (no flames if I'm wrong about this :-)

What I found to be interesting it that on the back of the most recent Atari Explorer magazine, there is an ad for PeripheralLand hard drives and such. The picture they use across the top half of the ad is THE EXACT SAME PICTURE that they used for their ad on the back cover of a NeXT magazine I recently picked up. The text at the bottom is slightly different, as they're talking about different drives for the Atari than they were for the NeXT, but the similarity in the ad layout is unmistakable.

Hmm, this whole NeXT business just gets curiouser and curiouser, wouldn't you say?

>4 colors to 4096!?

Well, I dont own a Lynx, but I do own a GameBoy. The only reason I
still keep my GameBoy is the size of it... Its nice and small, the
Lynx is big(ger)... But colour _would_ be nice! (and considering the
price of the Lynx, ~$90, its easily affordable).

BTW: I think the commercial was pretty neat. Speaking of Atari commercials,
tho. I have an old video tape of `The Hobbit` which I was watching the
other day. The copyright is 1977, but I think it was rerun in like 1985
or thereabouts. Anyways, one or more of the commercials was an Atari
ad for the 2600 game machine! (I do recall that for a short while
they tried to rekindle the market share they had for a while. just
MHO)

From the Holy Book of <1992Mar29.192012.23244@mailer.cc.fsu.edu>
as spake by boyd@nu.cs.fsu.edu :
> [...] Also note that "ls -l a*" will not generate a
> a long listing off all the files beginning with "a". It will
> usually do a long listing of all the files in the directory, and
> put it in a text file on your local machine called "a*" (which can
> be somewhat fun to delete). This is a feature, not a bug. [...]

You can prevent this by wrapping the arguments to `ls' in quotes -- for
instance, the command:

ls "-l a*"

will do what you expect. Another useful trick is to specify a pipe as your
destination file; if you want to read the file README.TXT from the archive, and
your favorite pager happens to be `less', you can use the command:

get README.TXT "| less"

and page through the text "on the fly", without having to download it and read
it locally. You can also combine these tricks (I think; I haven't actually
tried this); if, in our first example, there are lots of files beginning with
"a", you could type:

ls "-l a*" "| less"

and page through them.

The GCC 2.0 sources were released just one month ago. I had a look at it,
but I was sure that I neither have the HD resources (the tar-file is about
16 MB, if I remember right) nor the capabilities to do the adaption changes
necessary for the ST/TT.
A friend of mine told me that some folks in Germany with a lot of
experience from former GCC version are trying to port the sources at the
moment. I think we have to wait for the result...

Regards, Markus.

I have a Supra 30meg harddrive that I bought in 1988 or so, and the
symptoms are very identical, i.e. it suddenly would seem to slow down
and try to restart or something. Since I have second external harddrive,
I haven't bothered looking into it, but one thing I noticed was that
over the years some grinding whining noise was becoming permanent.
So in addition of checking the powersupply, it might also be the
drive axel which has more resistance than it should, and cannot keep
up the speed anymore. Please let me know if you find a fix.
In a START magazine they recommended putting a drop of oil on the
harddrive bearing, however I always assumed that you harddrives
are totally encased. Well, I'll look into it.
There are also companies that advertise trading in drives, are
rebuilding them, if it is the drive and not the power supply.

3294. ACE'92 show: Report

Newsgroup: comp.sys.atari.st
Date: 1992-04-05 00:18:51 UTC
From: Carlos Varela <EENG6801@RyeVm.Ryerson.Ca>
Message-ID: <92095.191851EENG6801@RyeVm.Ryerson.Ca>
Source record: 224038

Today I attended the ATARI CANADIAN EXPOSITION'92.
The two products that impressed me the most were GEMulator & MultiTOS.

MultiTOS:

Not too many people seemed to notice it, so I was able to play more
than half hour with it. I was able to run a line demo program twice,
Stalker, Tracker ST and Sutra on different windows. This was running on
a TT and it was slow. I mean slow. Like waiting for the directory to
show up. The programs run reasonably well on their own window, but
there were lots of bugs. For exemple, when a text file is displayed with
the show function the GEM doesn't tell the programs that its no longer
on the desktop and the space where the window should be gets updated over
the text. This happens even when clicking on the INFO box from the
Desktop. It updates over the DIALOG box.
The program is licensed from Eric Smith, he was there and admitted that
the kernel was the same as mint. Very nice meeting you Eric!!
Pressing CTRL+ALT+DEL boots the machine. After booting loads mint -m and
its set. I wasn't able to find which files were used to run MultiTOS
(nothing on the auto folder) but there were over 1.88Mb on the MINT directory.
After the programs are loaded, they appear in order of loading under
the accessories on the menu bar. The Atari representant said that
GFA Basic programs wouldn't run because they write all over the memory.
I tried a couple and they run fine. Maybe because the TT has a MMU.
Release date to be in the Winter (which one 92,93,94?).
It looked really nice, but many applications have to be upgraded,
the program will have to be faster and the redraws fixed.

GEMulator:

This was a very nice program running under windows. It was running
on a 486/33MHz. I saw many packages running on it without problems.
I tested German To English v1.9 and it run with the same speed as on my
1040ST. The screen was slow. It was redrawn 5 times a second. That's
because the memory has to be copied from RAM to the VGA card. Disk
access was also slow. The program comes with a card that lets you
install ROMs (There is a possible making it work as MAC as well??, I
didn't get very clear on this.) It handled my twist 800Kb disk
without problems. Darek said that this was just a preliminary version
and that the final version should be as fast as a MEGA STE (16MHz).
With 486/50MHz and 486/66MHz and 586 coming out soon, higher speeds
will be possible. It supports 4096 colors of the STE + STE resolutions.

>German Games..
>
>Does any one know of any more good PD. German games like Bolo,Esprit,Oxyd,
At first, Bolo & Esprit are *NOT* in the Public Domain. They are commercial
products (games)!
Oxyd, Oxyd 2 and Spacola aren't Public Domain, too. They are DongleWare.
DongleWare means, that you can play a while, but you'll need a dongle
(a book for Oxyd 1 & 2 / a map for Spacola) to solve it completely. You'll
get these dongles from the author. His address is stated in the games.

>Also how do you run Spacola and will it run on a UK. machine..
Simply double-clicking from desktop ;-)
I don't know, why they shouldn't run on UK-machines...

yours,

Benedikt

Source record: 224040

I'd like to have some titles of books (still availible), that would tell
me the following:
GEM C routines
(does anyone have a copy of c routines you could mail me??? please?)
a memory map of vectors, calls and other general adresses i need.
what not to do, (how to assure family compatibility)

this probably sounds like the developers kit, but I don't have the 300 bucks
or whatever it is to buy one right now. (do I need one anyway??)

thanks for the info

Also in the same issue of Atari Explorer, under News and New Products,
there was a column titled "Atari/PLI Announce Agreement," briefly this
stating that PLI will now support Atari TT and any other Atari
SCSI-compatible computers. It goes on to add some comment from PLI and
Atari execs, also some neato details on PLI's current drives :
- internal/external hard drives up to 2.1 gigabytes
- 3.5" and 5.25" magneto-optical drives (up to 600 MB)
- DAT based tape backup drives (2 GB capacity)
- 88 MB Removable drives
- CD-ROM readers

This is good news for anyone interested in high-power and brand
new storage technology, also it mentions that PLI may consider porting its
inter-platform translation software to Atari, allowwing "transparent file
sharing" between all the platforms it supports.

3299. For Sale: Atari 1040STe

Newsgroup: comp.sys.atari.st
Date: 1992-04-05 02:16:51 UTC
From: adhir@cygnus.umd.edu
Message-ID: <12351@umd5.umd.edu>
Source record: 224042

```
================================================================
| FOR SALE - FOR SALE - FOR SALE - FOR SALE - FOR SALE - FOR SALE |
================================================================

- Atari 1040STe with 4mb ram (about 2 months old...)
- 115 megs of HD space:
Seagate ST296N and Seagate ST138N w/ICD ADSCI+ Hoast Adapter
both mounted in a dual width, half height custom case (still
room for another 5 1/4" mechanism...I mounted the 138N behind
the 296 to leave room for a Syquest which I never ended up
buying)...powered by a 150watt XT power supply...
- SC1224 Color Monitor
- SM124 Mono Monitor
- Monitor Master switcher
- Spectre 128 w/Spectre v3.0 software
In case you don't know what this is, it's a Macintosh
emulator. Runs 20% faster than a Plus (actually it feels
more like a Mac II since the HD access is about 500% faster
and Macs rely heavily on disk access). 30 megs of HD are
dedicated to Spectre, with all the best Mac Apps running
flawlessly in Mac mode.
- LOTS AND LOTS of software...installed on the HD and on about
200 disks. Great apps (current versions) and great games (new
and old).

I am selling because I have to convert over to the PC platform due to
the nature of my job. I'll be sad to see it go.

Everything above for $1200 + COD charges (negotiable)
-----

Email me at adhir@cygnus.umd.edu or call me at (301) 441-2634.

Here's an excerpt from Z*Net Online Magazine #9214 on the new
Atari machines. Keep in mind that this is speculative, but
reasonably accurate. Read the issue for more info.

* The new machine is the first of another series of Atari Computers
that remain compatible with TOS.

* The new machine will be in a 1040 style case for "reasons which will
become obvious and very satisfying to all."

* The new machine will use a 68030 CPU.

* The new machine will very likely run a standard Super VGA monitor,
with colors, palette, and resolution similar to or exceeding the
Super VGA standards.

* The new machine will have industry standard ports, including SCSI
and others.

* The new machine will not have VME slots, but the VME slot has not
been abandoned in Atari's plans. The 1040 case dictates no slot in
this particular machine.

* The new machine will have a multi-tasking TOS.

* It is likely that memory configurations of well over 4 meg will be
possible in the machine.

* The digital sound will be BETTER than that offered by the current
"e" and TT series of computers. As these machines offer 8-bit
digital sound, look for 16 bit or more. The current DMA sound will
still be supported in the new machine as well.

* The use of the Motorola DSP sound chip WOULD NOT BE CONFIRMED by Bob
Brodie. However, he made no effort to refute the recurring rumor,
which originated with announcements from Motorola itself (reported
in Z*Net in late 1991). The "fact" of the new line of Atari
computers using the DSP was in each of the unofficial stories about
the machine shown privately by Atari at CeBIT earlier in March '92.
The DSP is used in the NeXT computers now to provide outstanding
sound digitizing power.

3302. SIMMs for trade/wanted

Newsgroup: comp.sys.atari.st
Date: 1992-04-05 03:20:56 UTC
From: aq115@cleveland.Freenet.Edu
Message-ID: <1992Apr5.032056.10391@usenet.ins.cwru.edu>
Source record: 224045

I have four 1x8 25K SIMMs that I'd like to sell, or trade all four
for a single 1x8 1 meg SIMM (100 ns or faster).

If you're interested, please email at one of the addresses below.
Thanks!

Rob

>I'm looking for two thing: A C compiler (PD preferably)

If you have a hard disk, gcc is the way to go. If you don't, I understand that you can get sozobon to work from floppies/ramdisks. In the commercial arena, I highly recommend Prospero C. It is rock solid, has a good optimizer, and excellent documentation of both the compiler and the Atari system architecture.

If you don't have a hard disk, GET ONE!!!

>and a terminal emulator
>(also PD if possible). I am currently using an early version of Flash that
>doesn't seem to support any kind of terminal emulation. It's frustrating, as I
>have to use the "dumb" terminal which, as you know if you've had to use it, is
>a royal pain in the vi editor. Anyway, if anyone has info on either of these,
>it would be much appreciated. Keep in mind, please, that I'm a poor student
>who can't shell out for a big-time commercial product :)
>

I thought that all versions of Flash could do vt100 (try <alt>-m, and select ansi), but I jumped on the wagon at version 1.5. There do exist patches to bring older versions of Flash up to 1.6 on atari.archive.umich.edu. You should get a copy of Uniterm, considered widely to be the best terminal program for the ST (and it's free, no less). It is also available from the above mentioned site.

I generally prefer Flash 1.6 (even though it does do weird things at 9600baud), because I really like the way you can get to the capture buffer with one mouseclick. Having this kind of scrollable editable tagable history buffer is invaluble to me (especially when I only have one "window"). Also, if you modem into unix systems alot, you should check out Unix Windows, which allows you to have multiple windows (each running their own shell) over a single modem line. Very neat stuff!

3305. We need to support!

Newsgroup: comp.sys.atari.st
Date: 1992-04-05 06:06:13 UTC
From: jared@midiline.la.ca.us
Message-ID: <3suqiB2w165w@midiline.la.ca.us>
Source record: 224048

That is the only answer. Agreed, Atari has messed up things a whole lot more than we would've liked, but does bashing them and stopping support do us any favors? No. If companies (or private individuals) just sat down and started supporting Atari ST/STe/TT/Falcon? irregardless of what failures there were, stores like Egghead and Sears might start seeing the care and desire for support, and start selling Atari software! It's a slim vhance, but every little pitch-in helps.

As of recently, I've begun to see what looks like increased support for the ST market. I'm still waiting for a local computer store to open up near my residance (I really don't like having to go to Glendale for all my ST needs, or through mail order), but maybe if we all (even those staunch IBM software companies) pitch in, we can begin to REALLY be proud of the computer everyone else thinks is... a game machine! Grrr!

Mayhaps one day, we'll hear this: "Hey, Bob, what kinda computer didja get yesterday?" "Oh, an Atari Falcon/030" "Whoa, Bob! You mean that really neat black computer that gives the NeXT a run?" "Yup. That one." "Atari isn't just a game company anymore..." "Hey, I knew that long ago." "But just the same, dija hear about the new Lynx TZ7..."

Instead of... "Hey Mike, wanna come over and see my new Atari Falcon?" "What? An Atari what? Falcon? Oh, you mean another game machine..."

Ciao!

Jared

3306. New Graphics Card: Spectrum

Newsgroup: comp.sys.atari.st
Date: 1992-04-05 13:33:58 UTC
From: jonal@sofus.dhhalden.no
Message-ID: <jonal.13@sofus.dhhalden.no>
Source record: 224049

Got a copy of the April ish of the German ST-Magazin yesterday while in Gothenburg (in Norway they only carry the crappy British mags, yuck...).

There were an ad for a new graphics card from Wilhelm Microtechnik called Spectrum. Apparently a 24 bit card as they advertised it as beeing "True Color capable". I think it might have 24 bit in 640x480. It had a max physical rez of 1170x910 in 256 colors from the 16.7 mill pallette. The rez was changeable, you could adjust it to suit your monitor (I suppose it supports One-Page monitors as well). It supported a virtual screen size of 4096x4096 with hardware scrolling. Sounds nice...

Additionally, it was said to be prepared for future enhancements like a blitter chip (probably some custom silicon under developement to accelerate the beast) and NTSC/PAL/S-VHS output for genlocking.

The card was available for the VMEbus machines and had a list price of DM 798,-. (about $500 I guess).

In the same mag, PAM advertised their line of VME/MEGAbus/ACSI Ethernet cards as beeing available in both Europe and the US. No mention of the US distributor though... NFS and X11.5 compliant software included. No price mentioned.

>Yes, but at least the GEMulator + 386 PC will be cheaper than a TT,
>maybe even cheaper than a MegaSTe?

You want to justify the cost of the emulator by comparing it to a TT??
fyi: the emulator runs slower than your out of the box ST,
the TT runs 5-7 times faster than a ST, and aprox 500 times faster
on floating point...

> This would be the same as a 68020.
> By definition a 030 has the 851 mmu built in.

WRONG ! You forget the data cache, the burst transfer mode !
Furthermore the 68EC030 has some reduced MMU to control cacheable data accesses
This MMU is called the ACU : Access Control Unit.

In fact, there is two ACs registers AC0 AC1, whose role is similar to the TTx
in 030's MMU.

-> The assembler coding for registers AC0 and AC1 is strictly similar to TT0
and TT1 on normal 030, which proves the fact.

Enjoy,

Vincent.

PS : BTW, the 030 has a subset of the 851 inside.

Who would want him (her???) ? :-) :-)

Just kidding! No Email flames please... that costs my sysop, flame me
here.

Personally I don't think that any company has to provide backup &
service.... that would hold them down and not let them develop & expand
for the future etc.
I think the support etc is best from other users.
That's why I'm here on Usenet, there's heaps of really nice atari
owners out there that'll do anything to help another atari owner
that's having problems.

Have a nice day.

Craig.

Could anybody of you be so kind to tell me where I can get the "atari.el"
for the GNUemacs! I got the 1857bin8.zoo from a.a and dumped it, but when
I start emacs after dumping it prints that it needs the term/atari.el file...

Where can I get it? (Or if it isn't too long could someone mail it to me?)

yours,

Benedikt

MIDI SHOWS IN LOS ANGELES
Last weekend, Goodman's Music had a gala two-day MIDI show and sale at Hollywood's Beverly Garland Hotel. Atari's Mike Groh attended the event that included significant support for Atari computers. Then Sunday, March 29, Mike attended a CUBASE/STEINBERG event hosted by Los Angeles's Mid-Cities Computer store. Reps from the manufacturers were "thrilled" with the turnout and interest in the new high-line of their software, designed to maximize the potential of the Atari TT030 in music studios. The continuing "Professional Series Music Seminars" will include a showing of Hybrid Arts' Digital Master EX and "the NEW Hybrid Arts product line" in another show this Sunday, April 5. Call Mid-Cities for information at 310-867-0626.

NEW TOUCH-UP COMING FROM MIGRAPH
Users of Mega STe and TT computers have had to disable their caches to use the current Touch-Up software (version 1.69). The problem has shown itself in the inability to scan an image without stray repetitions, like vivid shadows, around all images scanned with the cache in the normal position. The interim fix is simply to disable the cache before scanning. According to Migraph, a new version (1.8) of the Touch-Up scanning and editing software will be released in May. While details are not available yet, the marked increase in version number may indicate considerable improvements and new features. Watch Z*Net for more info as it becomes available.

CRAZY DOTS HAS NEW MODEL AND NEW LOWER PRICE
Gribnif Software has announced that their imported graphics card "Crazy Dots" has been well received, and that the volume they have experienced has allowed them to reduce the retail pricing. Crazy Dots 8 is the original "video display adapter" product, and will drive VGA and gray scale monitors with resolutions up to 1,664 X 1,200 and up to 256 colors or gray scales at once. Available in Megabus and VME versions, the price has been reduced by $150 from $999.95 to $859.95. If that isn't enough power for you, the new Crazy Dots 15 will do 32,768 colors or gray scales and the same resolutions. The new model is priced at the old model's original price; $999.95, and owners of the older model may upgrade for $199.95. Gribnif, P.O. Box 350, Hadley, MA 01035, phone 413-584-2565.

SALES-PRO VERSION 6.10 RELEASED
The popular and powerful point-of-sale and inventory control system for

the Atari ST has been updated by Hi-Tech Advisors. New features of Version 6.10 include 3 different payment types, more sorts on customer lists, displayed receivables balances, plus many other features, more speed, and bug fixes. Sales-Pro comes in many configurations starting as low as $99. Owners of older versions should contact Hi-Tech for upgrade information. P.O. Box 128, Ravena, NY 12143-0128, phone 518-756-3800.

POWERPOINT DEBUTS WITH NEW NETWORK
Chris Latham, author of the Universal Item Selector and the Universal Network (marketed by A & D Software) has formed a new company and announced that he will offer no further support of the earlier products or company. Latham's new company is called PowerPoint Software, and the first product from his new company is PowerNet, billed as the most powerful networking system to date for the Atari ST/TT line of computers. Similar to his earlier network design, the system works with Midi, LanTech LT101 and LT201 cartridges, as well as with the Mega STe/TT Local Talk ports. PowerPoint is offering a limited 'trade-in' for registered owners of Universal Network or SGS Net network software. The upgrade plan offers a complete 2-Node 'Starter Set' of PowerNet for 50% off of the regular $99 price. To participate, owners of the products must send in their FORMATTED original master program disks along with $49.50 (plus $5 S&H). Additional Nodes are $55 each; Midi connector boxes are $20 each; Local Talk connector boxes are $25 each; and a special 'Midi 2-Node Package' (complete with 2 connector boxes) is $120. PowerPoint Software, P.O. Box 942, Merlin, OR 97532, phone 503-479-6635.

ONE OF A KIND ATARI LAPEL PINS!!!!
The Eastside Atari Users Group, under authorization of Atari Corp., is offering a unique item that is a must to own. It is a limited edition Atari Lapel Pin. There are less than 300 of these pins in existence and no more of this style will be made. Readers of the Z-Net Forum will attest to the fact that Bob Brodie has endorsed this pin and recommends it highly. He has presented pins to Sam Tramiel and others at Atari Corp.. He wears them on his travels and is one of our biggest boosters. Due to the exposure we have had through Z-Net Magazine, Z-Net Forum, and GEnie, we have sent pins all over the world. As stated earlier, this is a limited edition item. Don't wait too long and miss out on this quality product. The cost of the pins are only $5.00 which will include shipping and handling unless you want to be nice and send an extra 50 cents. Volume discounts are available if you or your user group orders 10 or more pins. Then the price drops to $4.50 and no need to be nice about the 50 cent postage and handling. Send your orders to: Eastside Atari Users Group, 1504 Saratoga, Collinsville, IL 62234. We accept check, money order, or if you dare... CASH! Don't pas this opportunity buy to make yourself the envy of everyone else in your user group. EVERYONE will be asking where you got it!

SHARP PC-3000 DELAYED
A couple of months back Z-Net reported that the Sharp PC-3000 was ready for release. It seems we were a little premature with that announcement as hundreds of units now sit in the Toronto warehouse waiting for a addendum to the manual to be written. Apparently if it is used the way the current manual instructs you - the date does not change and the time is not current.

FALCON UNDER WRAPS
Although some information about the new line of Atari products has filtered out in the past few weeks - Atari still remains closed mouthed about its new Falcon. Dealers and Developers signing non-disclosures may be party to some new info at the Toronto show - but no promises. Rumour has it that Atari has approached third party developers for the MS-DOS emulation add-ons. Right now you will see a lot of smoke and no fire until late fall.

INTEL PLANS RELEASE OF 486 DX2 CHIP
What is it? Well after glancing through a performance brief of some forty-five pages and a technical reference manual of over one hundred pages we find that this chip is an accelerator. When used in conjunction with the 486-50 this chip performed on average the same as a 486-66 if there was one. Perhaps we are getting to old for these speeds as we regress to remember the Atari 800XL. Need to know more? Contact Intel and ask for: Intel 486 DX2 Microprocessor Performance Brief Order Number 241254-001 Revision 1.0 March 1992, Intel 486 DX2 Microprocessor Data Book Order Number 241245-001 Revision 1.0 February 1992.

ATARI COMES IN THIRD
In the February 10th 1992 issue of the Canadian Computer Dealer News Atari came in third right behind IBM and Apple for overall sales in Canada. IBM and Apple came in at 10.6 respectively while Atari came in at 3.2 of the market. Commodore didn't even make mention in the list while Compac and Tandy came in at 3.1.

ATARI-NET ANNOUNCED
A new network for those BBS's that choose to support the Atari platform of home computers has been announced. The name of this new network is AtariNet and can be accessed by any BBS that uses any Fido compatible mailer/msg tosser. Any BBS that wishes to join should send Netmail to either Bill Scull (1:363/112 or 51:1/0), Jim Goedhart (1:104/223 or 51:2/0) or Tony Castorino (1:102/1102 or 51:3/0). We have a parser for the Atari platform and I'm sure there are parsers for other platforms that will support multiple domains. Once you apply you will be sent a package that contains the parser and the latest node list. For any assistance you may need, you can contact any of the existing nodes and they will be more than happy to help you get started.

==========
* GLENCON 2 - The CODEHEADS! Exclusive for Z*Net by John Nagy
==========

Over 100 Southern Californians arrived by 10:30 AM last Saturday, March 28, for GLENCON 2, a "technical conference" featuring the local heroes, Charles Johnson and John Eidsvoog, better known as the CodeHeads of CodeHead Technologies. Held in an upstairs auditorium in a plush Glendale library, the event was the second in a series of support conferences sponsored by HACKS and John King Tarpinian, the people who also bring you the Southern California Atari Faire series, "The Glendale Show."

The event was opened by an hour talk and question session by Atari's Bob Brodie, who is personal friends with many of those who attended. Bob was a past president of one of the many Atari user groups that were represented from the greater Los Angeles area. Also on hand was Mike Fulton of Atari's technical group and another SoCal alum, who helped with some of the tougher hardware and software questions.

Questions outnumbered answers by a wide margin, as almost everyone in the audience had been following the "Falcon" reports that have appeared in Z*Net and online. Four out of five questions for Bob were asking for details that Bob couldn't give--yet. Bob was admirably polite and firm with his repeated refusals to "leak" more information, or even to confirm the details that have been accepted by most readers to be cast in stone. In fact, Bob urged the audience to be prepared to see final versions of the "new machines" that may differ from their expectations and the recent reports. He assured them, however, that the release versions will be outstanding and will meet their high hopes with equally high specifications.

Bob then played a short cat-and-mouse game, asking the audience "What would you REALISTICALLY hope for or expect from new Atari machines?" As the crowd called out their list of features, Bob would nod, or say "You could reasonably expect that to be our direction," or "We've been moving in that direction for some time," or occasionally, "That's not really relevant to our market," or "No consumer machine is going to offer that in the foreseeable future," or "That sort of thing would have to be part of a more upscale machine than the one we are going to be releasing first." All in all, a profile of the much rumored "Sparrow" or "Falcon 030" machine did emerge, and appears to be at least quite similar to that reported in recent Z*Net issues.

* The new machine is the first of another series of Atari Computers that remain compatible with TOS.

* The new machine will be in a 1040 style case for "reasons which will become obvious and very satisfying to all."

* The new machine will use a 68030 CPU.

* The new machine will very likely run a standard Super VGA monitor, with colors, palette, and resolution similar to or exceeding the Super VGA standards.

* The new machine will have industry standard ports, including SCSI and others.

* The new machine will not have VME slots, but the VME slot has not been abandoned in Atari's plans. The 1040 case dictates no slot in this particular machine.

* The new machine will have a multi-tasking TOS.

* It is likely that memory configurations of well over 4 meg will be possible in the machine.

* The digital sound will be BETTER than that offered by the current "e" and TT series of computers. As these machines offer 8-bit digital sound, look for 16 bit or more. The current DMA sound will still be supported in the new machine as well.

* The use of the Motorola DSP sound chip WOULD NOT BE CONFIRMED by Bob Brodie. However, he made no effort to refute the recurring rumor, which originated with announcements from Motorola itself (reported in Z*Net in late 1991). The "fact" of the new line of Atari computers using the DSP was in each of the unofficial stories about the machine shown privately by Atari at CeBIT earlier in March '92. The DSP is used in the NeXT computers now to provide outstanding sound digitizing power.

After a short break, the main event of the GLENCON 2 began, as John and Charles took the stage and alternately showed their products and fielded questions about them and the general future of Atari software.

Many, many questions and much interest revolved around the TEC board that allows new TOS 2.06 to be installed in old ST computers, and what all the upgrade really will do for users. The CodeHead TEC provides the complete kit with ROMS for under $140, and includes a manual for the use of TOS 2.06 that may be more comprehensive than Atari's own user documentation. It was asked if CodeHead would consider selling the manual alone for reference by owners of newer Atari computers that already have the newer TOS installed. Answer: Maybe soon.

WARP-9 was the other hot topic. CodeHead took over QuickST as of January 1, 1992, and has a completely re-done package that is so different, it has a new name. Warp-9 has over three dozen bug fixes and code enhancements over the last version of QuickST, and adds the CodeHead touch in configuration interface. New features are included and old ones tweaked, to give remarkable mouse, screen, background, and loading power. It should be shipping as you read this, and any QuickST or TurboST owner can upgrade for $20 with proof of original purchase (formatted original disk, manual cover, receipt, etc.).

The balance of the conference featured an overview of line of CodeHead products, including HotWire, MaxiFile, MultiDesk Deluxe, CodeKeys, Lookit/Popit, Cherry Fonts, and the new graphics powerhouses MegaPaint, Genus, and Avant Vector. The public was invited to swarm the stage in order to get a good view of the products in action on the 19" TT monitor. (An overhead projection unit was on hand but unable to be used--the library's projector was indeed "available" as promised in the building, but not until set up time on Saturday did the library staff

add that it was not allowed to be used by "outside groups.")

The conference broke up at about 1:00 PM, and resumed informally at The Computer Network, a Glendale Atari dealership. Hundreds of people turned out during the afternoon for the store's open house. Demos were done by the CodeHeads and others, and everyone got a chance to chat with the Atari Celebrities. Notable musicians stopped by, including members of The Beach Boys band.

Organizer John King Tarpinian says that the event was a success all around, and that future Glencon meetings will probably focus on MIDI and DTP, hopefully with a hands-on session with Calamus SL and other software. John's intent in the series is to acquaint users with products that are either hard to grasp by reading about them or looking at the box at dealers. With presentations by the developers themselves and opportunity for questions and answers, users can much more effectively judge their own need and ability to use high-powered software and hardware.

HACKS, the local user group headed by Tarpinian, is also preparing for this fall's "Glendale Show", to be held September 12 and 13, 1992, at the familiar Glendale Civic Auditorium in Northern suburban Los Angeles. Dealer/developer packages will be sent out beginning in MAY. For more information, contact HACKS at 818-246-7286.

======================================================================
* ST - BRING ME MY MINT JULEP by Norm Weinress for Z*Net
======================================================================
```

The magical letters, DSP, are appearing in talk about future Atari computers, but most people don't know what they mean. This is a brief introduction into Digital Signal Processing.

The "signals" we are talking about are (take a deep breath) analog waveforms. To us, that is mainly video and audio signals. When you want to do something other than just see and hear the original picture or sound, you need to process the signal. So, to mix more than one signal, or improve it, or change it in any way, you must process it.

This processing used to be done by analog circuits, but nowadays, you can digitize it and then play with it digitally. That is, your computer can modify it. But these signals are changing rapidly, and to process them in real time, the computer has to be really fast!

That's where DSP chips come in. They are computer processing chips that are especially tailored for this work...to do tricks with digitized analog signals in real time. To do this, they have been trimmed of many functions required by a general-purpose chip, like the 68000 in your ST. That means that they usually work as a second processor in a computer, doing their special job under the direction of a regular CPU.

Adding a DSP to a regular computer gives it capabilities in creating and reproducing a lot of neat video and audio effects. Until recently, they were so expensive, only a few people used them. But as they become cheaper, many more uses for them are being discovered. Like maybe we'll be sending pictures as well as messages on our local bulletin boards, and replacing the keyboard with voice input! Well, OK, not next week. But this is the necessary first step toward those goals.

==========
* THANKS FOR THE MEMORY by John Nagy
==========

The following article is reprinted in Z*Net by permission of AtariUser magazine and Quill Publishing. It MAY NOT be further reprinted without specific permission of Quill. AtariUser is a monthly Atari magazine, available by subscription for $18 a year. For more information on AtariUser, call 800-333-3567. ST/TT for January 1992 AtariUser (v2n1)

ALERT: RAM PRICES continue to fall. One megabyte DRAM chips are at or below $7 most anywhere, while 256K chips are around $2. One meg SIMMS cards can easily be found for $50, and as little as $30 each at swap meets, but look out for USED CARDS that might not be stable. 256K SIMMS (only good for bringing a 520 STe up to a meg) are only about $15, but hard to find... except from other STe owners who have upgraded above 1 megabyte. For use in a normal ST or even an 68000 accelerated machine (not a 68030), any "speed rating" of 120 nanosecond OR LESS is fine. The smaller this number, the faster the memory, being able to properly record and deliver data in shorter times without error. These days, 80 NS is a common rating.

Upgrading your ST RAM, maybe by Yourself!

Probably the number one upgrade for Atari computers is the addition of more memory. Most of us bought a 520ST or 1040ST and soon found that we needed/wanted MORE MEMORY. There are lots of how-to articles detailing the installation of more RAM. Many companies offer kits for you to upgrade your memory yourself, and most dealers will do it for you for a price. But what do you get, and how should you choose?

You might consider doing your own upgrade without a kit. Instructions for several upgrades can be found on Genie, CompuServe, Delphi, and BBS systems, or from your club library. But beware: there are lots of ST board revisions within each model, and plans that are written for one may NOT work for another. Atari kept things interesting by re-using board revision letters on different revisions. Except for the very competent (or adventurous) hobbyist, only a few models of Atari computers should be considered for kitless upgrades.

PLUG AND PLAY

The newer-generation machines (Stacy, TT, STe) have sockets for plug-in memory cards. Upgrading memory is as simple as changing or adding cards. You should be able to do an upgrade based on this article, but

AtariUser (and I) can't be responsible for any damage you might do to your machine while trying to follow these directions. If you're in doubt, don't do it yourself.

For any work to be done inside a computer, take special care to avoid static electricity. One little snap can end the life of a computer. Working on a foil-covered table, preferably grounded, and always touching the foil before touching the computer board can help. Don't work over carpeting, and of course don't work on the innards when the power is on or attached!

Getting inside Atari computers is no big challenge. The screws that have to come out are usually in squarish holes. Other ones can stay, at least until you are inside. Little bend-tabs or more screws hold most of the internal shielding together. I won't go into further detail--if you get lost before you get inside, stop!

On ANY STe machine, the memory cards are common plug-in modules called "single in-line memory modules", or SIMMS. These can be bought through most electronic supply, computer supply, and swap meets. "Page mode" SIMMS are used, by far the most common and inexpensive, and the MAC SIMMS are the same. Atari uses 8-bit wide, but the 9-bit wide (with parity bit, used in IBM) can be used without modification. The cards are available in 256K and 1 megabyte sizes.

All STe machines appear to have four SIMMS sockets (despite scattered scare reports to the contrary). Memory configurations can ONLY be 512K, 1 meg, 2 meg, and 4 meg. The TOS can tell what memory is available, but can't use any in-between sizes, so mixing cards for intermediate memory totals can't be done. In a 520 machine, a 256K card will be in slots 1 and 3 (counting from the front of the sloping unit). In a 1 meg machine, all four slots will have 256K (you CAN'T do one meg with one card!). A two meg setup has a 1 meg card in positions 1 and 3, and a 4 meg setup has all four with a meg each. Those are the ONLY combinations that work. But it's as easy as plug and play!

A few things to watch out for, however, include some memory cards (even the ones that may come in your Atari) that have through-pins protruding past the circuit board far enough to touch another card in a full installation. They don't matter if you have only 2 cards, but to use them with 4, you may have to trim those pins with tiny clippers. Just look it over carefully, and beware static electricity when handling and clipping.

STACY 2 machines are different, using more rare low-profile "SIPS", or "single in-line package" RAM, using wire leads instead of the bulkier card-edge connector of SIMMS. The Stacy 4 machines are not socketed, but the 2 meg model is. The Stacy 1 is a rare animal, but at least one company (JRI) offers a special board to upgrade it to two or four meg. But just getting inside a Stacy portable ST is involved enough to scare most of us off. This is a good one to let the dealer do.

In the new TT series, memory upgrade is easy but pricey. Both "ST RAM" and "TT RAM" for the TT is on special proprietary circuit boards, and can't be populated with common swap meet chips. Atari list prices: 2 meg ST RAM, $379.95; 8 meg ST RAM, $1,199.95; 4 meg TT FASTRAM $759.95; 16 meg TT FASTRAM $1,999.95. Aftermarket TT memory boards are just beginning to appear at more competitive prices and with a wider range of size options--up to 32 meg so far! (Check the product releases area in the January 1992 issue of AtariUser.)

OTHER KITLESS UPGRADES

Making a 1-meg machine out of most 520STFM units is nearly as easy, but takes soldering and some technical advice. These computers are (usually!) just like 1040STFM's but with 16 chips missing. The printed chip outline and solder holes are there, but usually soldered closed. Add the 256K x 1 RAM chips (getting almost free these days!), resisters or capacitors if they aren't there already, and change a pair of memory control lines. That's the catch--the control traces are different on each board revision. You'll need a more thorough set of directions that we have room for here, sorry. But the electrical traces on the circuit board are VERY delicate, and can be burned right off the board with the wrong technique or too hot an iron. Use a small soldering iron, 30 watts or lower, anytime you work on computer circuit boards.

Similarly, most Mega 2 computers are just Mega 4's waiting to happen. You'd add 16 one meg chips--sometimes! A few late production Mega 2 machines had no traces or places for the additional RAM chips, making it impossible to simply "finish" it into a Mega 4. Also, some machines (mostly later production) have an MMU or buffer chip that can't quite deal with more than 1 or 2 meg, even though it was fine as built. You might have to replace one to get your unit running. Get detailed technical help or documentation before you start.

It's said that "real" Mega 4 computers that failed a memory test in the high banks during manufacture were sometimes "repaired" by knocking them down into Mega 2 machines via a couple of trace cuts. If you happen into one of these, you might find that an upgrade will cost you only one or two chips and a trace repair. Finding the bad chips(s) on the board would be your only challenge.

Kitless upgrades for other Atari configurations require desoldering existing parts, cutting traces, adding jumpers, piggybacking chips on each other, and a variety of other frightening procedures that each are able to turn your computer into a doorstop if done wrong. Kids, don't try these at home. Buy a kit.

KITS

You'll see plenty of memory upgrade kits offered for sale in this and other Atari publications. One meg, 2.5 meg (a really nice working size!), and 4 meg sizes are offered, and many of them let you do a little now and add to your memory later. All of the current crop seem to be quite operational and satisfactory, but each has its fans and its

idiosyncracies. Here's what is said of each, but these are neither endorsements nor condemnations. Check the ads and talk to the dealers to find the one you want.

JRI: Using SIMMS and an all-soldered-in arrangement, this is the favorite of many shops as a dealer upgrade, but is more work.

TECH SPECIALTIES: The company's anti-customer attitude was the worst part of this early unit, preferred by many.

ZUBAIR: A pin-grid arrangement for attaching to the MMU requires hot glue to be stable, plus a leg-insulation scheme requires extra care. Not as easy as advertised but good docs.

AERCO: An early favorite, sometimes leaves a gap in the case of 520/1040 units. Documentation was poor.

EZ-RAM: A pronged device that pushes into the MMU socket works but can creep out be difficult to get into the socket. The company (Terrific) appears to be defunct.

XTRA-RAM: Imported, "solderless", uses SIMMS. Requires a reconfiguration of jumpers for different memory that can be confusing. Still good overall.

DEALER INSTALLATION

For most of us, here's your best choice: let your dealer do the dirty work, and you won't have to worry which method or kit he uses. Any of them will work fine if installed correctly, and that's the dealer's job. And dealer installation is the only way you get the peace of mind called a warranty.

I contacted a dealer local to me who installs the JRI unit into 1040 machines, 2.5 meg for $259, and 4 meg for $359. He prefers the soldered unit because "they never come back, no matter how the machine is handled," but says that other units using clips and less solder might be better for a novice to install. Call around; most of the dealers you see advertising in AtariUser will do upgrades via mail.

- John Nagy, with special thanks to Tony Lee of the Computer Network, in Glendale, California, (818) 500-3900.

A tutor who tooted a flute
Tried to teach two young tutors to toot;
Said the two to the tutor:
Is it harder to toot, or
To teach to tutors to toot?
Anonymous

The first messages we encountered this week were from forum members who were questioning the Atari File Finder (ATARIFF). Specifically, the frequency of updates and the software used to manage all that 'stuff.' The thread moved to a discussion of CompuServe itself, and the massive amounts of time and energy used in operating this beast. SYSOP Bob Retelle gives us a little insight into one of CISs competitor's systems in his message..."[do they have] a bunch of multi-ton air conditioning units on the roof running 24 hours a day, 365 days a year... or have and entire building full of heat producing mainframes, disk drives and all kinds of ancillary processing equipment making heat for those air conditioners to cool...

The electric bill at our installation is incredible... (we even have four huge diesel generators and rooms full of huge batteries for those times when Edison can't supply us with what we need :)

And that's only for the main building... maintaining a world-wide data network means having installations in every major city where you have customers, a staff to keep that network running, and phone lines to tie them all together..

And phone bills..! They use the empty printer paper boxes to store the phone bills... several of them... each month..!

They keep telling us to shut off individual disk drives when they're not in use to help keep the electricity bill down... (that "modern" TTL stuff seems more suited for electric toasters than for computers.. :)

You're right, the bottom line is probably more than any of us (except Pattie, maybe) could imagine spending... but it's a heck of a lot lower than it might seem at first..."

Admittedly, some of us seem to relate to the telecomputing maze by what appears on *our* screens. It's easy to forget the complexity of a system like CompuServe when we're online. It sure is humbling to realize what we're actually connected to!

But getting back to the subject at hand, we can't blame *just* the software for a sometimes "slow" system. We can blame... well, we'll quote Greg Wagman right about now: "I begin to see the sort of balancing act that CIS is doing with communications, users, hardware, disk space and network bandwidth. I sure hope they've got some good tools for monitoring the aforementioned. If I were in their shoes, I sure would have... <g>

Jim, what you say seems pretty obvious, but the scroll rate for messages in such large bases would become even faster than now. For example, in the MIDI forum it's a couple of days (like, 2). If they increased the number of message sections without significantly growing the file size, many (most?) messages would scroll before they were read... not an exciting prospect <g>.

The obvious answer is to provide more storage. Part of their problem may be that there tied into old Operating software that doesn't allow

transparent disk sharing (a la NFS or RFS). That way, the user load could be spread across hosts and multiple hosts could share the disk resources...

Ah, well, I'm sure there are good people at CIS who bemoan exactly the same things. Been true of every place *I've* ever worked ("What we could do if we had...").

Early on in this thread the discussion quickly turned to money; specifically, how much CIS makes! There was no clear answer, only speculation. But what speculation! Even conservative estimates placed the figure at *many* millions per year. Per month! Anyway, it doesn't look like it's gonna slow down, overall! Sure the economy has taken a few hard blows, it's tax time and an election year (in the states-keep forgetting about you folks who aren't in America-sorry!), but one thing we will always need is information, and we want it fast and accurately. And we're getting it. Just about *anything* we want.

This may sound like an ad for CIS, but it is not. Considering the total system, with all it's nuances, mechanics, data and users (!), we think that it is safe to say that the people running the CIS operation are doing a phenomenal job and a tremendous balancing act.

Well, let's hop off the CIS carousel now and jump back on the Atari roller coaster... <wheeee...> Robert Delius Royar writes, 'I bought an ST in 1986 because

1. I liked the 68000 instruction set and wanted to learn it better

2. A license just to work on a mac at any decent level was 3X what I paid for the ST + docs + developer's pac (and the Mac license did not include hardware)

3. The screen on the ST (in color even) was far easier on my eyes than any PC then available. The dot pitch on the old SC1224 is still better than a lot of those VGAs being marketed

So I still like my ST. It's a joy compared to the IBM and Mac computers I use at work. It communicates better with a Vax (using Uniterm) than the PCs and the Macs do using pricey emulators. I can write my own tools and even do all sorts of legal low level stuff with the Bios and xBios that IBM never dreamed of. And even Gem code requires fewer parameters than the equivalents on the other machines. I just wish I could find a C source translator that would convert my ST /Gem stuff into Windows or the Toolbox/QuickStart code so I could port software to those "low-end" machines the rest of my colleagues and student use.

Alternatively, I wish Atari could afford to provide Hardware to schools (as do IBM and Apple) so we could get a platform for development.

Robert Royar (English teacher, programmer, and converted Atari user)"

And no, this is not an Atari ad, but it could be. Even for those of us who can't program -Print "Hello World"- the Atari has remained incredibly easy to use and totally flexible in a wide array of applications.

So why the sudden optimism here? Well, when we consider the amount of trouble we get from so many other machines and businesses we deal with, it's nice to acknowledge the things in out lives which work with and for us rather than against us. Isn't that enough of a reason to thank them?

THANKS ATARI AND COMPUSERVE!

Ah, that feels better, back to business <snarl>. We noticed that the POOLFIX has itself been fixed! There is a version out of Germany called POOLFIX4 (we believe it is on CIS). Charles over at CodeHead tells us that the latter version follows the XBRA protocol. This led to a discussion of vectors which led to a little confusion on what vectors actually are. Boris Molodyi, as usual, had some helpful comments to make: "Vector, in this case has nothing to do with vector fonts :-) It's a place in memory, storing the address of some subprogram in OS. Usually, it is used for interrupt handling. For example, if you use a mono monitor and pull the cable out of your ST, it generates some sort of interrupt, the system looks for a certain vector, and transfers execution to the address this vector points to (hence vector). In this case it happens to be a warm boot subprogram."

Rob Rasmussen countered: "OK, then why are they called Vector fonts and graphics? I know what they are, I think, just curious about the name.

To which Keith Jackson replied: "Because the positions of two points can be described in two ways. If you simply put that they are so far apart then you have a scaler quantity. If the _absolute_ positions are quoted you need both distance and direction so they would be so far apart and an angle of ??? degrees (say). That is described as a VECTOR quantity.

Vector graphics use mathematical descriptions to produce shapes. Their advantage over bitmapped images is that they can be scaled without loss of quality. To double a bitmapped image requires four times the dots, hence the blockiness. Doubling a vector graphic simply places all of the nodal points further apart but the line is drawn between them each time so it doesn't deteriorate."

Does all this stuff actually *happen* whilst we bang on the keys and drag our mouse around, always tapping on the base of it's tail area? You bet it does. Any sometimes things go wrong, but it pays not to loose your temper and keep it light. Consider this exchange concerning a problem with a version of Quick CIS. The parties are Richard E. Paddock, Neil Burton and, of course, Jim Ness:

Fm: Richard E. Paddock
To: Jim Ness

Jim,

You may remember a while ago that I complained about the mouse-into-the
-menu-bar-and-disable when the Read Messages dialogue was open? Neil
mentioned the same problem in a message, and I suggested he try the
test. And he found it. So I guess you need to dig that fix out again.

Dick;

Fm: Jim Ness
To: Richard E. Paddock

Dick -

I wasn't able to reproduce the mouse problem myself.

Could you repeat exactly how you make it happen?

To: Jim Ness
From:Neil Burton
Watch me Jim...

.
.
.
.
.
.
.
There... Did you see what I did ??? 0-)))))) <BIG CHEEKY GRIN>"

And in the All-You-Can-Do-Is-Feel-For-The-Guy department, we hear from
John Damiano: "I have had a major disaster. Something (Adspeed
problem..I don't know wiped out my HD and then when I tried to restore
it from the Syquest it wiped out that too.!"

Ouch! HD and back-up gone! Later in this thread (it seems we all had
horror stories) we read: "Any backup that is not convenient to do is a
backup that will never get done."

To close on a somewhat happier note <pun intended> we scanned the MIDI
library in the Atariarts forum and discovered there is a proliferation
of music files (MIDI standard and other formats) and programs to
satiate most musical tastes. From Editor/Librarian programs to works
by Bach to a light show for you color monitor, you'll find it in
Library 5 at your nearest Atariarts forum.

Later...

==========
* PORTFOLIO OWNERS UPDATE by B J Gleason
==========

The following article is reprinted in Z*Net by permission of AtariUser
magazine and Quill Publishing. It MAY NOT be further reprinted without
specific permission of Quill. AtariUser is a monthly Atari magazine,

available by subscription for $18 a year. For more information on AtariUser, call 800-333-3567.

PORTFOLIO ALERT:
You are lost in a maze of twisty tunnels, all alike. The Original Adventure game, Collosal Cave, has been packed onto a ROMCard for the Portfolio! $49. Contact the Monterey Bay Whaling Company, (408) 475-4290.

256k, 512k, and 1 Meg Memory Modules are available for the Portfolio from DIP systems in England. They work just like RAMCards, and measure 20*50*70mm. Contact DIP, 32 Frederick Sanger Road, Surrey Research Park, Guildford, United Kingdom, GU25XN. (0483) 301555. The prices (in pounds, check exchange rate when ordering): 256k - 182.56; 512k - 252.13; 1 Meg - 373.87.

Another Portfolio newsletter, but with a difference: a disk. David Stewart, editor of the "Re:Port Newsletter" publishes bi-monthly. Re:Port will give you insights into how the Portfolio works and provides at least two programs on disk (3.5" or 5.25") per issue. Re:Port also offers discounts on Portfolio products. Newsletter/disk subscription, $50 for six issues. Re:Port Newsletter, 1618 South Beech Court, Broken Arrow, OK 74012.

NEW CARDS FROM ATARI: As this column goes to press, Atari is releasing several new ROMcards for the Portfolio. The first one is Portfolio Chess. This is one tough player, and allows you select your own skill level. The Instant Speller, a program to spell check your documents is also here now, as well as a Limited Edition "Terminator 2: Judgement Day" Card, in conjunction with release of the movie on videotape.

THE PORTFOLIO CHRONICLES Tiny, tiny Desktop Publishing

Desktop Publishing on the Portfolio? Well, not exactly. But new software allows you incorporate screen snapshots from the Portfolio into your documents--and vice versa, sort of...

PGCAP is a new program that will "capture" a screen image on the Portfolio and save it to a disk file. This Terminate and Stay Resident (TSR) program is requires less than 1k of memory, and is activated by pressing <ALT-S>. This will copy the contents of the screen to a file on your disk. Depending on the screen mode, the file extension will be .PGT if in text mode, or .PGF is the screen was displaying graphics. The main filenames will be "SCREENA", "SCREENB", etc., to allow you up to 26 screens per session.

TIP: Each time you start PGCAP, it resets the filename back to SCREENA. Be sure to save the original images before starting a second session.

Once you have captured the screen images, you can PGCONV to convert them into a form that can be used by a desktop publishing package. PGCAP will import .PGC, .PGT, and .PGF files and export .PGC, .PGF, as well as .IMG (Gem) and .WPG (Wordperfect). Figure 1 is a image from

the Portfolio that has been converted into an .IMG file.

...AND BACK AGAIN...

The reverse is also now easy. PGF Maker is a program for the Atari ST that lets you make screens by simply cutting a part of any DEGAS format monochrome ST screen. Now making company logos or any graphic for use on the Portfolio can be done using scanners and graphic editors on the Atari ST, then clipped to Portfolio screens with no loss of resolution. The results are quite impressive. Bruce Coleman programmed it in GFA Basic, and asks a shareware fee of $10. PGF Maker is available on the telecom services or directly from Bruce at 456 Archglen Way, San Jose, California 95111.

ANIMATION

On the Portfolio? YES! Don Messerli, of the Software Vinyard, has been working furiously on an Animation Package for the Portfolio, and the results have been staggering. Depending on the complexity of the image, the package is able to display anywhere from 16 to 20 images per second on the Portfolio's LCD screen. To see the results of his labor, download PGFLIX, the animation package, and either DOMINOS.ZIP or HORSE.ZIP, the mini-movies. Mr. Messerli has also released a tool so that you can create your own animation, called MKPGX1. Word on the street has it that the APORTFOLIO forum is going to host a contest for the best PGFLIX animation in February or March.

BIO: BJ Gleason is an instructor of Computer Science at The American University in Washington D.C., and he's been programming for over a decade. He's the author of over two dozen utilities and games, including PBASIC 4.9, the 'freeware' BASIC interpreter designed specifically for the Portfolio. His Email address is BJGLEAS@auvm.american.edu and his Compuserve ID is 73500,2517.

==========
* BASIC AT COMMANDS -=- Part 1 of 3
==========

This article discusses configuration registers and result codes and contains a comprehensive list of basic AT commands, as well as the extended AT command lists for those modems equipped with MNP5 and V.42/42bis. In addition, for your convenience, modem default lists have been included.

Here are the sections discussed in this article(s):

DO YOU NEED TO READ THIS FILE?
ABOUT AT COMMANDS
THE AT COMMAND LISTS
RESULT CODES
CONFIGURATION REGISTERS
PROGRAMMABLE OPTIONS NOT SAVED IN NVRAM
PROGRAMMABLE OPTIONS SAVED IN NVRAM

DO YOU NEED TO READ THIS FILE?

The beginning paragraphs of this file contain general information that will acquaint you with AT commands. You will probably want to read these paragraphs, and then browse through the other sections. Later, you can refer to this file as you learn more about your modem. Keep in mind that most user-friendly communications programs allow you to manipulate AT commands via easy-to-use, menu-driven software; however, there may come a time when you will need to directly manipulate your modem. This file will come in handy when that time comes.

ABOUT AT COMMANDS

Your new Megahertz modem uses Hayes commands, also known as AT commands, to communicate with your computer. For this reason, the Megahertz modem is said to be Hayes-compatible. The Hayes command set is what you or your communications package uses to tell the modem what to do and how. As you might expect, the Hayes command set was developed by Hayes, the modem manufacturer.

Hayes commands can be thought of as "words," all of which make up a "language." This language, like most others, has a specific syntax that must be used in order for it to be understood. Typically, these commands operate invisibly. In other words, when you execute a function of a communications program, such as automatic dialing, you don't particularly notice that the program issues an ATD dialing command.

A basic understanding of Hayes commands and how they work will be useful as you learn to operate your modem. Sometimes, you will need to change an AT command or string in your communications program so that the modem will operate as desired. For instance, if you use a phone with a pulse rather than a tone dial, you must change the communication program's AT command from DT to DP. In addition, many communications programs allow you to communicate directly with the modem. For instance, instead of using a program's dialing directory to initiate a call, you can type ATDT, the phone number, and any other specific AT commands, directly onto what is commonly refered to as the Terminal Mode Screen, and the modem will carry out the requested functions.

Note: Terminal mode is the mode in which you can communicate directly with the modem. Most communications programs have terminal mode capabilities; however, you will need to check with the documentation that came with your communications program for the exact mode name and instructions on its use.

All Hayes commands, except the REPEAT command A/, are preceded by the attention command AT and followed by a carriage return <CR>. In essence, this initial attention command, as the word attention implies, lets the modem know that its services are required; the modem will carry out the commands that follow the initial AT command.

THE AT COMMAND LISTS

This section contains three lists:

1) Basic AT Commands
2) MNP Commands
3) V.42/42bis Commands

The last two lists apply to you only if you have purchased a Megahertz modem that has the letter M incorporated into its product name, such as the P224FMV, AR124M, C324FM, etc.

NOTES:

1) In the following lists, <CR> is used to indicate that you need to hit the Enter key.
2) The letter "n", as in Bn, is used to indicate a variable, such as 1 or 2, that you can change according to what you desire the modem to do.
3) The command buffer holds 40 characters before a connection is made. After a connection is made, while in the escape state, the buffer holds 10 characters.

Commands &W and A/ do not work after the modem has gone On-line.

1) Basic AT Commands

* (AT) Attention Code:

The attention code, "AT", begins every command line except A/. AT may be entered as upper or lower case characters, and cannot be deleted using backspace or delete keys. More than one command can be placed on a single line and separated with spaces for readability. The command line must end with the ASCII character stored in S Register 3, which defaults to decimal 13 (Carriage Return). A line with no carriage return will be ignored. Commands following the AT are processed after receiving the carriage return character. This attention code is used by the modem to detect the bit rate and character format of the connected Data Terminal Equipment (DTE).

Example: AT <CR> An OK message should be returned.

* (A) Answer Command:

This command causes the modem to go off-hook and take control of the telephone line (in answer mode) from the associated telephone set. After receiving this command, the modem cannot accept any more commands because it immediately answers the call and goes into the data transmission mode. While in the data mode the Escape code (+++) will return the modem to the command mode.

Example: AT A <CR> You should hear a high-pitched tone.

* (A/) Repeat Command:

AT does not precede this command. The repeat command instructs the modem to execute the last command line stored in the command buffer. For example, the repeat command can be used to redial a number that was

previously busy. This command is neither followed by a carriage return nor preceded by the attention command AT. THE COMMAND BUFFER IS LOST AFTER ENTERING THE HANDSHAKE MODE. Once in the handshake mode (the period between when the host answers the phone and data is transmitted) the command buffer changes from 40 characters to 10 characters; therefore, the last number dialed is lost after entering the handshake mode.

Example:

AT DT 123-4567<CR> Dial the number indicated.
BUSY Indicates line is busy.
A/ Repeats last command which is the dial command

* (Bn) BELL/V.24 Protocol Compatibility:

The B command selects the protocol for 300 and 1200 bps operation. This command selects the mode of the data set between CCITT V.22 and V.21 and Bell 212A modes.

The B command is ignored when the modem operation is at 2400 bps. B0 sets the modem to CCITT mode for 300 bps to 1200 bps data transfer. The default, B1, sets the modem to Bell 212A mode.

The B0 (CCITT Mode) protocol sends 2100 Hz for 3.3 seconds and 75mS of silence followed by unscrambled ones in the answer mode, while the B1 (Bell) protocol simply sends 2225 Hz.

The transmitted signal in the originate mode sends scrambled ones at 1200 for both B0 and B1.

Example: AT B0 <CR> Selects CCITT mode.

* (Ds) The Dialing Commands:

The D command causes the modem to go into auto-dial mode in switched line, or to originate a call in leased line mode. The parameters for this command include digits 0 to 9, touch-tones A to D, *, pound sign, the period and slash, P, R, T, comma and semicolon. Punctuation (parenthesis, hyphen, and spaces) entered for readability are ignored. Dialing command parameters are described below.

P,T These parameters select between pulse and tone dialing.
Dialing begins after the timeout period defined by register S6.

Example: AT DT <CR> Selects tone dialing.

, The comma causes the modem to pause for the time specified by register S8 (default is 2 seconds). This parameter is used, for example, to cause the modem to pause between dialing an external access code from a PBX and the actual telephone number.

Example: AT DT 9,123-4567 <CR> Tone dials 9, then pauses for 2 seconds before dialing the remaining numbers.

; A semicolon placed at the end of a dialing command places the modem in command state and does not provide connection with another modem; rather, it holds the line and waits for other commands. After the modem dials the numbers that precede the semicolon, it will return the result code "OK." This parameter is useful when dialing long numbers.

Example:

AT DT 1-800-123-4567;<CR> Dials the first number.
AT DT 4567890<CR> Then without dropping the line, dials the second number as well.

@ The @ parameter causes the modem to wait for the time specified by register S7 for one or more rings followed by 5 seconds of silence before going to the next symbol in the dialing string. S7 default is 30 seconds.

Example: AT DT 9 @ 123-4567<CR> Dials 9, then waits for 5 seconds of silence before continuing with the rest of the numbers.

! The flash command causes the modem to go on-hook for 1/2 second. Flash might be used for transferring calls.

S Dial number stored in NVRAM (See &Z Command).

R The Reverse command at the end of dialing permits the establishment of a call in reverse mode, ie, the local modem, which originated the call enters the "answer" mode. This would be a useful command for communicating with an "originate only" modem at a remote site. The R modifier needs to be the last character of the dialing string.

Example: AT DT 123-4567R<CR> Dials the number then places the modem in answer mode.

W Causes modem to wait for a dial tone while dialing.

Example: AT DT 9 W 123-4567<CR> Dials the 9, then waits for another dial tone before dialing the remaining numbers.

* (En) Echo Command:

The Echo command determines whether or not the modem will echo the characters sent to it while in the command state. E1 causes the modem to echo, which is the system default, and E0 sets the modem to no echo.

Example: AT E0<CR> Echo off
AT E1<CR> Echo on (default)

* (Hn) Switch-Hook Control:

The H0 (default) command will cause the telephone line relay to disconnect. The H1 command will cause the telephone line relay to go off hook.

Example: AT H1<CR> Takes the line off hook. Equivalent to
removing the receiver on telephone hand set.

* (In) Request Product Code & Checksum:

I Requests the product code. The modem will respond with 24x, where
x equals the software Revision Level.

I1 Causes a checksum to be computed on the Rom and returned as three
ASCII numeric characters followed by a carriage return and line
feed.

I2 Returns a computed message (the message "OK").

I3 Requests the firmware revision level.

I4 Requests the modem to display its configuration settings.

Example: AT I <CR> Returns the internal rom revision level.

* (Ln) Speaker Volume:

L, L0, L1 Low volume
L2 Medium volume (default)
L3 High Volume

Example: AT L3 <CR> Sets the volume of the speaker high.

Note: Also see the Monitor on/off commands "M, M0, M1, M2 and M3".

* (Mn) Monitor On/off:

This command switches the speaker monitor amplifier output. The
default will be on except when receiving carrier.

M : speaker is off
M0: speaker is off
M1: speaker is off while receiving carrier (default)
M2: speaker is always on
M3: speaker disabled while dialing or receiving carrier

Example: AT M0 <CR> Turns the speaker off.

Also see commands "L, L1, L2 and L3".

* (On) On-line:

The O command is used to return the modem to the on-line mode after you
have brought it to the command mode with the escape code (+++). O1
will cause the modem to return to the on-line state and initiate a
retrain sequence (in 2400 bps only). Also see &D and the Escape code
sequence (+++).

Example: AT O <CR> Returns from terminal mode to on-line mode.

* (Qn) Result Codes:

The Q command determines whether or not result codes will be sent after the execution of commands. The code Q0 (default) directs the modem to return result codes. When set to Q1, the modem will not return result codes. S Register values, identification codes, check-sum results and results of test modes with self-test are returned.

Example: AT Q1 <CR> Modem will not return result codes.

* (Sr) Direct Register Commands:

AT Sr? This command returns the Decimal value of the S Register r stored in the controller.

AT Sr=n This command writes the binary equivalent of n base 10 in S Register r. The range of n is between 0 and 255.

Modem configuration variables are stored in the S Registers. Some registers are dedicated to one function, and some registers are bit-mapped in order to store information about the status of different commands. For an intelligent DTE, it may be easier to write the desired data into the S Registers, rather than go through the process of stepping through each of the AT commands. An understanding of these registers will allow you to configure the modem at any time, and to change only the parameters you want to change. See the section entitled CONFIGURATION REGISTERS.

* (Vn) Verbal/Numeric (verbose/terse)

The Vn command selects the type of result codes the modem returns after or during the execution of commands. V1 selects word result codes (default). V0 selects digit result codes, which are useful for intelligent terminals or computers. see the section entitled RESULT CODES.

Example: AT V0 <CR> Causes numeric result codes to be returned.

* (Xn) Enable Extended Result Code:

AT X0 or X CONNECT MESSAGE - CONNECT
DIALING - Blind (set delay before dial)
DIAL TONE TIMEOUT - No
BUSY DETECT - No

The modem blind dials and waits the time period defined in S Register 6 regardless of the absence or presence of a dial tone. The modem sends a CONNECT message after a connection has been established.

AT X1 CONNECT MESSAGE - Full messages (CONNECT 1200 ETC.)
DIALING - Blind (set delay before dial)
DIAL TONE TIMEOUT - No
BUSY DETECT - No

The modem sends a CONNECT message for 300 bps, 1200 bps or 2400 bps after a connection has been made. The modem blind dials and waits the time period defined in S Register 6 regardless of the absence or

presence of a dial tone.

AT X2 CONNECT MESSAGE - Full messages
DIALING - Waits for dial tone
DIAL TONE TIMEOUT - Yes
BUSY DETECT - No

The modem sends a CONNECT message for 300 bps, 1200 bps or 2400 bps after a connection has been made. The modem waits for the dial tone before dialing. A NO DIALTONE result code is returned if a dial tone is not received in five seconds. The modem does not recognize the busy signal.

AT X3 CONNECT MESSAGE - Full Messages
DIALING - Blind
DIAL TONE TIMEOUT - No
BUSY DETECT - Yes

The modem sends a CONNECT message for 300 bps, 1200 bps or 2400 bps after a connection has been made. The modem blind dials and waits the time period defined in S Register 6 regardless of the absence or presence of a dial tone. The modem will recognize the busy signal.

AT X4 CONNECT MESSAGE - Full messages (default)
DIALING - Waits for dial tone
DIAL TONE TIMEOUT - Yes
BUSY DETECT - Yes

The modem sends a CONNECT message for 300 bps, 1200 bps or 2400 bps after a connection has been made. The modem will wait the time period defined in S Register 6 before returning a NO DIALTONE, or will dial if the dial tone is present. The modem will return a BUSY message if the busy signal is detected (2400 bps modem default).

* (Y) Enable Long Space Disconnect:

The AT Y or AT Y0 command sets the modem to disconnect when a space of 1.6 seconds or more is received from the remote modem. The default setting of Y0 disables this option. Command Y1 enables this option. A space of 4 seconds is sent prior to going on-hook upon receiving an H0 command or detecting an ON-to-OFF transition on DTR if the &D option is selected.

Example: AT Y1 <CR> Enables long space disconnect.

* (Zn) The Reset Command:

The Zn (n=0,1) command resets all the features of the modem to the values contained in external nonvolatile memory in location n, and then returns "OK". Any command on the command line after the Z command will be ignored. On power-up, the profile in location 0 will be recalled (ATZ0).

Example: AT Z1 <CR> Reset modem and recall profile 1

* (+++) The Escape Code:

The escape code returns the modem to the command state from the on-line state without releasing the telephone line. This command consists of an escape guard time (defined by register S12, default 1 second) and an escape character (ASCII code of which is specified in register S2 default "+"). The escape character must be entered three consecutive times with a guard time before and after the three characters.

The modem returns to the local command state and sends the result code "OK" without releasing the telephone line connection.

Also see the "0" and &D commands.

Example: +++ While in on-line mode, issue escape sequence.
OK Modem will return OK message.
AT <CR> Issue any AT command.
OK Modem returns OK message.
AT O <CR> Returns modem back on-line.

* (&C) DCD Options

The &C0 (or &C) command maintains an ON condition on DCD and ignores the actual state of the data carrier from the remote modem. For the default &C1 command, the DCD signal tracks the state of the data carrier from the remote modem (this meets most software requirements).

Example: AT &C1 <CR> Data Carrier Detect follows actual state of the carrier.

* (&D) DTR Options

The &D command is ignored in synchronous mode. When &D0 or &D are specified, the modem ignores DTR.

After the &D1 command the modem will go from data mode to the command state on an ON-to-OFF transition of DTR. All changes in the state of DTR must last longer than the time specified in S register 25.

For the &D2 (default) command, an ON-to-OFF transition of DTR will cause the modem to go on-hook, disable auto-answer and end in the command state. Auto answer can be re-enabled by turning DTR back on. All changes in the state of DTR must last longer than the time specified in S Register 25 in order to be recognized.

For the &D3 command, the modem will assume the initialization state if it detects an ON-to-OFF transition on DTR. All changes in the state of DTR must last longer than the time specified in register S25 in order to be recognized. The result of this command is the same as that of the ATZ command.

Example: AT &D2 <CR> Modem reacts to state of DTR.

(Part 2 Next Week)

~~~~~~

To sign up for DELPHI service, call (with modem) (800) 695-4002. Upon connection, hit <return> once or twice. At Password: type ZNET and hit <return>.

~~~~~~

To sign up for GEnie service call (with modem) (800) 638-8369. Upon connection type HHH and hit <return>. Wait for the U#= prompt and type XTX99436,GEnie and hit <return>.

~~~~~~

To sign up for CompuServe service call (with phone) (800) 848-8199. Ask for operator #198. You will be promptly sent a $15.00 free membership kit.

Strange, Acorn is manufactured in the UK, where it has a substantial market
share (though mainly in the education sector). That you have not heard of the
Archimedes goes to show that it is not only Atari that have abysmal marketing.
The Archimedes has been available from 1988 and the A5000 model from 1992.

The A5000 spec is quite impressive, as is that of the Atari Falcon. These
machines have different strong points and different weaknesses, but they are
both modern systems and worth checking out.

Last I checked, Kuma are still listing the Occam compiler, but the transputer box was not in the catalogue. Maybe they still make them to order, I have not asked them about it.

>Is there an English translation to the cs-tex document(s)?

No, there isn't any. If you wait for the next version, the english README file will be somewhat more extensive than the last one, but that's it. There IS an english version of the shell, if you just play around you should figure out most of it.

Sorry that I can't help you more than that. If anyone sends me an english translation of all or part of the docs, Christoph will be happy to include it in the package.

Or US machines, or Australian machines? I dont know ANYONE outside
continental Europe that has had OXYD (1 or 2) or Spacola working.
OXYD runs, but then you can't play because the first level is
all Death (crumbling floor, no exits, death walls). Spacola comes
up and you can click on one thing, then NOTHING.

3317. **** TERMINAL PROGRAMS ?? ****

Newsgroup: comp.sys.atari.st
Date: 1992-04-06 00:21:01 UTC
From: vortex@cats.ucsc.edu
Message-ID: <32126@darkstar.ucsc.edu>
Source record: 223909

Hey all. What terminal program is most used for the ST? Are there any good free term programs that I can grab off the nets? I have acquired an ancient version of Flash, but I haven't a clue as to what I should use now!

Thanks!
vortex@cats.ucsc.edu

3318. Terminal server idler?

Newsgroup: comp.sys.atari.st
Date: 1992-04-06 01:20:09 UTC
From: jartsu@hut.fi
Message-ID: <JARTSU.92Apr6032009@saha.hut.fi>
Source record: 223910

Hello!

I am looking for a program, preferably an accessory, that keeps my terminal line up when idling.
The terminal servers I am using break the connection if there has been no input from the user in 30 minutes. So I would like to find something that allows me to set the ASCII value and the time-interval of the char and then it sends this char to the RS-port according the time-interval. And if it could even be auto-starting, like begin this idling when a certain time has passed since the last RS-traffic or a certain string comes from the RS-port.

Some challenge for programmers? Of course this all should be able to run background...

The prolific Jwahar R. Bammi has apparently done some work on it, and it SHOULD be going up on the Michigan archive fairly soon. (This from some personal mail - I suggest that people NOT fill his mailbox with requests!) He thought it was uploaded - there may be some sort of bottleneck at SOME point... Archive maintainers should maybe take a look around and see if GCC 2.0 is maybe hiding in a subdirectory somewhere!

I too am looking forward to it. I ftped the distribution, and unarchived it. It actually shouldn't be TOO bad to try to compile it - a LARGE portion of the 16MB of files is made up of support for various CPUs, MOST of which are not in the M68K series. I'm sure that 10MB can get discarded. (i.e. - machine definitions for 88ks, 80?86, MIPS, 32032 (or something like that), among others, as well as specific support files for particular machine/OS combinations (NeXt, NCR, Gould (?), Sun, ...).)

You'll probably need 4MB of ram to compile the system, tho... or maybe 8!

3321. Re: TOS 1.62 for sale

Newsgroup: comp.sys.atari.st
Date: 1992-04-06 03:17:30 UTC
From: aq115@cleveland.Freenet.Edu
Message-ID: <1992Apr6.031730.14097@usenet.ins.cwru.edu>
Source record: 223913

I'm afraid your TOS 1.62 ROMs will NOT work in any ST. They are
higher-capacity ROMs than the older 1.0, 1.2, and 1.4 versions.
The older ones are 192K total capacity, and TOS 1.62 is 256K.

I suggest you keep them around. Someone is bound to come up wiht
a piggyback board with a switch so you can toggle between the two
TOS's for compatibility purposes.

Just a couple of questions I need confirmed about the SST
(I talked to Dave Small at ACE, but the 'flyer' about the SST doesn't make it
clear and seems to imply the opposite)..
Is the non-mega SST available? I have a 1040STFM..
ALSO, do I _NEED_ to have 4 megs in my ST before being able to add memory to
the SST? The flyer kept talking about adding memory to the existing 4M...
Finally, Is the Megatalk board REALLY important?
Can I add a CD-rom without one?
Will a megatalk board run in the good old MEGA ST's (as opposed to STe's)??
I may have to pick up a used mega st soon if this is the case..

Thank you,

>Atari can lic. the OS. NeXT will lic. their OS.
>It would not be a real difficult adaptation.
>It would be slow on '030 hardware.

Not only would it be slow, but you'd have to ramp up the basic hardware just to make it run, even at the slow pace. Can anybody see people shopping in the Atari market shelling out for machines with 8 - 32MB of RAM, 300MB+ of hard disk, 17"+ color monitors, etc. (and don't forget the $1000 - $2500 for NeXTstep, if Atari were to follow NeXT's NS486 pricing), just to sit around waiting on the OS? (Okay, it's not that bad; I never had to use an original '030 Cube, but I can't imagine not having the '040, and people I know who've used both claim the difference is like night & day.)

NeXTstep is incredibly lean compared to the punch it packs (I have to live with SVR3 and X11R4 at work), but lower end machines need an OS that's even leaner. For the '030 or less, Atari should stick to MultiTOS or something along those lines. NeXTstep is not just anything that Atari needs for its market, anyway. Also, Atari is not something NeXT needs for its market.

The other thing is that I'm not sure Atari's pricing could be all that superior to NeXT's. The basic NeXTstation mono (now a 33MHz '040) lists at under $6000 CDN right now, with 8MB of RAM and 200MB of disk, incl. NeXTstep and all the other hardware and software goodies that round the system out.

At the time I bought my mono station (just a 25MHz '040 with 8MB of RAM and 100MB of disk, at the same price the new mono station is now), the TT had been available here for a short time. The price was $4000+ CDN for a slow '030 TT with 4MB of RAM, 80MB of slow disk, a basic SM124 mono monitor, and no software except TOS (nor was any TT-aware software, e.g. the rumored Unix port, available to be bought, except Calamus and DynaCADD, that I knew of). I made the obvious choice. :~)

That was early 1991, and I haven't kept track of what Atari has been doing until recently in this newsgroup. But they'll have to do a heck of a lot better than that TT offer to make people consider them. Even then they

have a tough time, since people looking for machines of this caliber are not necessarily primarily motivated by price, which has always been Atari's main advantage.

(PS for the curious or flame-prone: I sold STs for over 3 years at two then-leading Atari dealers in town, so I'm favorably disposed toward the company. I think it would be neat for them to come back [or arrive for the first time, in some respects]. I also use my NeXT to cross-develop software for my ST. The ST and things Atari just matter less to me now; I have another black sheep computer to play with and evangelize. :~)

Hi there,

working on my diploma thesis, I need to know whether there is an
implementation of the graphics standard PHIGS on the ATARI ST.

If so, what is the price? (I hope it's PD!)
which bindings do exist (C, Pascal etc.)?

Thanx for your answer

Frank

Source record: 223918

Yes, Formula 1 Grand Prix has finally been released for the ST. I haven't seen it yet, but my brother has a copy. Apparently it is very similar to the Amiga version except:

1. The sound is poor (Stunt Car engine sounds)

2. The still pictures are 16 colours instead of 32

3. The screen update is faster

It comes on 4 disks, the first being single-sided so that people with a SS internal drive but a DS external drive can use it. It is not obviously hard disk installable, but you can backup the floppies. The box also claims that it requires 512Kb RAM, but I can't verify that this is true.

Lets hope David R. Watters doesn't read this group.

>how much it costs, or if there is a demo? Thanks.

There is no demo version because licensing agreements do not permit
that (what would you do with a demo version without fonts?).
The recommended price is DM 548 in Germany, for prices in other
countries ask the local distributor (which for the US is Goldleaf).

Sozobon C is a good little package to get you off the ground for little more than a few disks. If you get it in full, as you should from any good PD lib, you get loads of source code. I think you even get the code for the compiler, linker, etc.

I cannot remember as I have not used it for a little while, but I do know that you could do alot worse than it. If you have any probs getting it...contact me and I will pass on the name of the people I got it off, of I can copy it for you.

>I've been having a bit of trouble with the EXEC command from GFA Basic
>2.0.
>The manual says the input is EXEC flg,nam,cmd,env where flg=0 load and
>run, or flg=3 just load. nam is the string that holds the name of the
>program to run. cmd is the command line (this is the problem) and env is
>the environment.
>The manual states that if cmd is not going to be empty i.e. "", the
>(cmd is C$) format is Chr$(Len(C$)) + C$ + Chr$(0). I can't get that to
>work.
>If someone has an example, or could point me to one, I would appreciate
>it.

REM Reserve some memory for GFA to use
RESERVE 6000
REM here is how the EXEC command works
REM It will use the program 'ARC.TTP' on the C drive in the folder UTILITYS
REM and pass the command 'X C:\DOWNLOAD\FILENAME.EXE *.*' to ARC.TTP
a%=EXEC(0,"C:\UTILITYS\ARC.TTP","X C:\DOWNLOAD\FILENAME.EXE *.*","")
REM Return the memory back to GFA when ARC.TTP is done
RESERVE

a% will hold a value that will indicate how ARC.TTP did. This number is the
number returned from ARC.TTP. A zero indicates that all went well. The most
common number other then zero that will be in a% is -39 (Out of memory) in
which case you need to increase the RESERVE number. If you get -33 (file not
found) or -34 (path not found) then you typed in the wrong path or filename in
the 'prg' part. Dispite what the manual says, you do not have to terminate
each part with a CHR$(0). GFA does that automatically for you.

Rather then doing all that stuff you did above with C$, it's much easier to
just do this:

C$=C$+CHR$(0)

Works the same way in GFA.

BTW, dump GFA 2.0 and get 3.x. It's only $150, and the improvements are WELL
worth the upgrade fee!

* Origin: FlightLine PointNet (1:282/47.1)

Sozobon C is a good package to start you off. Its totally PD and so will cost you the price of a few disks. Its generally available through most PD libs, or was when I got mine. Mine had loads of source code with it...I think it even had the source for the compiler, linker, etc.

It comes with a very large manual (on disk) which is quite useful if you can handle the printing out! Overal, very good for a few pounds.

Source record: 223924

It works! It really works!

I played with the Gemulator at Derek's booth at the TAF Show in Toronto this weekend. It's really impressive. You can even run Xformer on it so you can run your 8-bit programs on the 486.

It runs multiple ST sessions under MicroSoft Windows. We were running monochrome PageStream and a color game at the same time.

So far as I could tell, there weren't any ST programs it couldn't run. Derek had piles of disks from all the developers who were at the show and was trying them all.

It does have a limitation on not being able to run some copy-protected disks because there isn't the direct connection between the disk system and the ST system as on real ST hardware.

Since it needs a real set of TOS roms to run, there is apparently no problem with Atari Corp.

Derek said it will sell for somewhere in the $300-$500 range and will be announcing general availability within the next several months.

> on floating point...
>
>

Actually, according to Derek Michocka (whatever...the author), on a 386/33, the Gemulator will run a little faster than a standard STe. On a 486/33, it should run about twice as fast. On whatever comes next, it's speed will increase accordingly. Not only that, but you can actually multitask with it running. You can have Gemulator running as a full screen DOS session under Windows or OS/2 and switch between it and other DOS/Windows/OS/2 apps. Another cool thing is that Darek was hinting towards the fact that it will actually run Spectre 3.0! So we'll have Mac, ST and PC in one box.

My question is whether it will support an aftermarket sound board like Soundblaster Pro to emulate the STe sound...

I need your help,
I'm a student at the Universite de Sherbrooke in Quebec, Canada. I
have to make a presentation in front of the class on operating
system concepts, my choice was the TOS.
I have more than 30 magazines on ST and 3 books from Micro Application,
but I can't find what I looking for.

I want to know:

-What TOS is for? Tramiel Operating System???

-What does TOS do?

-What is the diference between TOS 1.0, 1.1, 1.2, 1.4, 1.6 and 1.65??

I know that TOS 1.0 and 1.1 was on disk, TOS 1.2 was a chip, and
from TOS 1.4 when you format a disk it use MS-DOS type.

-What version is the Rainbow TOS? what does it do than the others dont?

-What is the new features on TOS 2.? an TOS 3.?

I know I ask you a lot, but I REALY NEED THESE INFORMATIONS.

3335. GEMulator

Newsgroup: comp.sys.atari.st
Date: 1992-04-06 13:56:12 UTC
From: ant@mks.com
Message-ID: <1992Apr6.135612.8211@mks.com>
Source record: 223927

I've seen it!!!! GEMulator is real.

I was visiting my local computer store on Friday here in Waterloo, when I saw Darek there preparing a machine with GEMulator for a Toronto Atari Show this past week-end.

The GEMulator ran under windows on a 486 machine. He had some commerial ROM board plugged in that had TOS 1.4 on it. He showed it running under all three resolutions on the one machine using the clone's colour monitor. He also showed some software like Laser C working and assorted other material. He even commented that some (NOT all) protected software would run under the emulator (I did not get any titles but I suspect any protected software that does NOT change the disk step-speed would work). All that seems to be missing is hard disk support, which is forth coming.

I was not at the Toronto show, but he's intent was to show the public that at least a 386 in flat-memory mode, could in fact emulate an Atari ST. I know not about an STE or TT. For his demo he used a 33Mhz 486 with 4Mb of memory (I think). If the response from the show is favourable he'll begin taking orders in the near future else he begin work on other projects.

3336. RAM upgrade problems

Newsgroup: comp.sys.atari.st
Date: 1992-04-06 14:21:15 UTC
From: rfriedel@csd4.csd.uwm.edu
Message-ID: <1992Apr6.142115.13952@uwm.edu>
Source record: 223928

I have some problems with a Z-RAM 3-D/4 Meg upgrade that I recently bought over the net.

The problem is that I get multiple bombs at various times, but especially at boot-up. The bombs can be stopped by "rocking" the interface board in the video shifter socket; i.e., unseating and then reseating the interface.

I have cleaned and lubed the video shifter socket. The power supply voltage is right at 5 volts. The problem seems to be more prevalent when I have my hard drive connected but it does happen even when it is disconnected. I have resoldered the video shifter socket pins on the bottom of the main CPU board. I looked for a broken circuit board trace but did not see any.

System info:

1. 1040 STFM with TOS 1.4 with board revision D.
2. 1 internal DS/DD drive and an external SF314 (DS/DD).
3. Atari SH205 hard drive with a 40 meg Seagate mechanism.
4. SM124 mono monitor and SC1224 color monitor running through a Data Spec switch.
5. The RAM chips in the upgrade are Seimens running at 70 ms.
6. The MMU clip seems to be stable and not causing any trouble.
7. I disconnected the normal on-board RAM by removing the addressing resistors (33 ohm).

I am running a 2.2 version of Quick ST, I believe.

Any help?

I was at ACE '92 as well.

I thought it was funny that many people, after a few minutes worth of conversation, would say something like: "I'm strictly under non-disclosure, *but* I have seen Atari's new machine and it's great. It has graphics, sound, blah blah blah."

I did see a TT running Unix though. I logged in and poked around a bit. They've got BSD (4.5?), X11, OSF, Motif, related software. Some of those terms mean little to me but the Atari guy rhymed them off.

The price ends up being something like $2500 for the Unix operating system, a 130Meg 17ms access time HD. This is on top of the price of a TT. It was hooked up to a 19 inch monochrome monitor. I'm not sure if the big screen was part of a deal or not.

He also said that they were not really pushing this or making big noises because it was intended for their new machine (and then I got this line again about being under non-disclosure, but a new fast machine exists and it's great etc...).

I'm not affiliated with anybody or anything, don't know anything more than what's been posted so far.

Greetings.

We've got an ST with a mouse that appears to be on it's last legs. (In particular, it seems to be growing less and less sensative to clicks and double-clicks.) We needs a new mouse before a concert to be given April 24. I called the only local dealer listed in the phone book, and was told that they only had rebuilt mice (for $42.00) and that ordering a new one would take a month. Not good enough. What's the *FASTEST* way to get a reasonably priced ($60 sounds reasonable to me), decent mouse to Washington, DC? Any good sources?

Thanx.

Message-ID: <1992Apr6.155224.4970@nntp.hut.fi>
Source record: 223932

TOS is short for The Operating System. Thus spake Tim Oren.

It does what operating systems do.

Rainbow TOS is another name for TOS 1.04.

TOS version numbers seem to reflect the machines they are meant for. 1.x is
for the ST, 2.x is for the STe and 3.x is for the TT. The hardware of the
machines is not uniform.
Also, it is commonly thought that TOS versions with bigger numbers have less
bugs.

Hope this helps,
s.a.

One person's review of the Toronto Atari show

Lee Dickey
April, 1992

Lets start with what I saw at the Atari booth. (1) The TT was front and center here, with several set up in various configurations and a few with very large screens. There were music applications and so called workstations being shown. There was also a new monochrome screen, a bit bigger than the original Atari mono screen being shown. I liked the look of it, but someone near me noticed that the number of dots is the same as with the original, so up close the resolution is not as good. But if you sit back a bit from the screen it looks better. Maybe this product is for the aging population of Atari users who need to sit back from the screen because their lenses are hardening in their eyeballs. (2) The notebook sized computer is bigger than a palmtop and smaller than a laptop. I saw two of these when I arrived, but one was not working, and the other had a low visibility screen and it did not have a floopy drive. Several folks standing around me wondered how they would load their programs into this machine if they were to get one. (3) There was a big crowd of kids around the Lynx section. I dont share their enthusiasm for this product, but then I don't generally play games on my ST either. (4) There was no Stacy in sight.

There were some good software sellers there. Codehead, Gribnif, Brumeleve, Double Click, Joppa, HyperLink, Soft-Logic, Step Ahead, and Sudden, for example. Local Toronto dealers were out in force, and there were some US vendors were here for the first time, such as Toad Computers, Best Electronics, and Goldleaf.

Toad Computers was showing their hard drive packages, which use the ICD controller boards. The ICD franchise holder for Canada was there, in support of his dealers, and this year he had a list of dealers, and this year, he was more polite to those Canadian folks who had purchased ICD products before he got the Canadian franchise. Speaking of ICD, I saw one of their tape backup systems. Surprisingly, this system still seems to be the only one available for the ST, albeit at an outrageous price. They do use data cassettes, which I think of as being cheap. One user told me that the downside of this product is that it is painfully slow to find and restore a single file from the tape. When I heard the process described, it seemed to me that it would be faster to restore a whole partition to the hard drive, and then copy the sought file to the right location.

When is someone going to develop the software to support the use of off-the-shelf video cassette recorders? This stuff should not have to cost an arm and a leg.

Mike Vedderman, of Double Click software, was there showing off his new Data Diet, a boot program which gives full and automatic file compression on the fly. You can specify, if you prefer, not to compress certain kinds of files, but why not compress? This product can extend the capacity of your disk drive.

Nevin Shalit, author of Tracker/ST was there. This program is a mailing list and mail merge program which looked pretty nice to me. As he demonstrated, I could not think of a feature that anyone could want that he did not already have.

Joppa Software Development was there, showing their new STraight FAX! product that allows the ST or TT user to send/receive faxes. To demonstrate the two-way capability, they had installed a miniature telephone system with the Atari set up on one line and an ordinary fax machine set up on another. As for sending faxes, STraight FAX! has drivers that can convert to fax files an ordinary text files or any of several forms of files, such as Calamus, Pagestream, FSM, etc. Faxes you receive may be printed on your favorite printer, such as a dot matrix printer or an Atari Laser printer.

Two accelerators were shown. One is the SST by David Small, and the other is TinyTurbo030, from Turbo Technology. These run, I think, at about 33 MHz and 40 MHz respectively, but SST claims to have the fastest Atari ST. Sounds like a mystery to me. Both products allow RAM expansion to over 30MB. These products seem cheaper and more powerful than products directly from Atari themselves. David Small gave a talk about the SST. One fellow who heard it said that he came away with the feeling that this guy sure can ramble on about everything except what he wanted to hear. I did not attend, because I that had been my impression last year.

The Gemulator from Branch Always Software was shown. It is a program that runs on an IBM PC and emulates an Atari ST. Derek Michoka was there with a 33 MHz clone runs the Gemulator at about 85% of the speed (my timings) of an 8 MHz ST. One surprise for me was that the Gemulator can run inside window on the PC. I won't be running out right away to buy the Gemulator, cause my Atari is still going fine. When the day comes that I want to double the speed of my ST programs, it may make more sense to get a 16 MHz Atari than a 70 MHz PC clone. But, it is nice to know that there is some insurance out there, because if (when?) Atari folds up, there is a path in the PC clone line that would allow me to run some of my favorite Atari software. If someone is forced to move to a PC and they still want to run their Atari programs, the Gemulator provides a way to do it.

There was a lot of music stuff. One attendee that I talked to was quite excited about the direct to hard drive recording technology. He told me that it takes uses about 10 megabytes to hold about a minute of

music. He was looking at a product with price tag of about 5000 dollars. He said that if he had had this thing a couple of months ago, he would not have had to sub-contract some work for his current project. Now can not wait to get his hands on one.

Goldleaf of Larkspur, CA had a quadruple booth and a great demo, but I saw no bumpf, no glossy handouts describing the characteristics of their system. They were showing picture editing systems. They had everything. Start by scanning a color image, then use the full editing capability on your TT, and finish by producing any form of hard copy you can imagine: color prints, transparencies, film negatives, or decals that you put on your tee shirt. I suppose that it was with a system like this that National Geographic created the scandalous "photograph" of the pyramids. The prices I heard in this booth were like those that one might hear in a new car dealership.

3344. Re: HELP ME on TOS 1.? 2.? 3.?

Newsgroup: comp.sys.atari.st
Date: 1992-04-06 17:23:32 UTC
From: aq115@cleveland.Freenet.Edu
Message-ID: <1992Apr6.172332.29891@usenet.ins.cwru.edu>
Source record: 223936

```
Let's see...

TOS 0.8 was the original, disk-based TOS.

TOS 1.0 was the first in-ROM TOS.

TOS 1.2 was the next update, which came in the new Mega ST's, and
featured Blitter support, and improved hard drive capabilities a
little.

TOS 1.4, also known as Rainbow TOS, further improved things, like
fixing the FAT search problem in the older TOS's, it sped up hard
disk access considerably, it fixed Flow Control (for high speed
modems), and a few other things I'm not sure on.

TOS 1.6 was the first STE TOS. It was nicknamed miSTakE TOS,
because it was impossible to boot into medium resoution without
a special patch program.

TOS 1.62 fixed the medium res boot problem. I'm not sure what else,
if anything, was fixed.

TOS 2.05 is the TOS currently shipping in the Mega STE. It features
the new desktop features (called "Newdesk" by some, but according to
Atari, that's not its name), like keyboard shortcuts, custom icons,
program icons on the desktop, etc. Flow Control was screwed up
again in this version, and requires SERPATCH2.PRG to operate
properly.

TOS 2.06 is the current upgrade to TOS 2.05. It fixes the flow
control problem, and adds support for high-density floppy disks.

TOS 3.05 and 3.06 are pretty much identical to 2.05/2.06, except
that they're designed to run on the 68030 (TT).

The offical word from Atari on the TOS conventions is that the TOS's
are actually called 1.0, 1.02, 1.04, 1.06, 1.62, etc. They're always
EVEN numbers (except in the case of 2.05/3.05).

Also, the official word on the meaning of TOS is "The Operating System."

If you need anymore help, email me.

> | ((((((((| Z*Net International Atari Online Magazine

Please don't post the electronic magazines in comp.sys.atari.st. They contain advertising material that some site managers consider to be in conflict with rules governing the use of certain components of the Internet. They are too long to be processed by the news software at some Usenet sites. They contain long passages of information not germane to comp.sys.atari.st.

Because of these and other considerations, mailing lists have been established for the email distribution of the electronic magazines to sites that cannot conveniently get them from the FTP archives in Michigan.

To subscribe, contact stzmagazine-request@virginia.edu.

If you have easy access to the magazines, it would be *great* if you could forward them to the mailing list moderator. Delivery of them hasn't been very regular.

> - or have I problems with my machine ?

You've run out of room in the root directory, which is of a fixed size.
Subdirectories are really a special type of file, and can be expanded
to contain any number of entries.

In other words, put your files into a folder and you won't have this
problem.

Is it possible to send e-mail from the net (internet, bitnet, whatevernet) to any of the pay services (GEnie, CompuServe, etc.)? I ask because a good friend of mine will be going home to Puerto Rico in a couple of months, and we want to be able to correspond via e-mail. (I guess another question would be if anyone knows of any place in Puerto Rico from which you can send netmail.) He can get CompuServe in Puerto Rico (I don't know about GEnie), and I will sign up for it if necessary, but was wondering if there is a way to send e-mail to someone on CompuServe, or any of the other pay services.

Hello,
Wasn't there an announcement months back from Atari that FSM GDOS
was ready to ship? Does anyone know of someplace that sells it?
Is it still being packaged with Word Flair II?

There is a demo (of sorts) available - but it runs on VGA PC's. The demo is for Virtual Reality Studio, which is a renamed version of 3D Construction Kit, and probably isn't much enhanced (it runs in 320x200 VGA mode). The demo is of an adventure game created with VRS, and (at least on a 386/33) runs very nicely. I got the demo from "sunee.uwaterloo.ca", or it is also available on CI$ ("GO COMART", look in library 13 for VRSDMO.ZIP).

My point is, I don't think a 030 is available w/o a mmu.

>
> WRONG ! You forget the data cache, the burst transfer mode !

Yes, I did forget to mention that.

But both caches are so small it is hardly worth mentioning.
You han hardly fit a small loop in the instruction cache. (From high
level languages. Hand crafted assembly is a different story.)
Also, most machines that I am familiar with do not have 2nd level caches
where burst mode would prove to be the most beneficial.
I think the hot HP 030 box did, and possibly the Mac2fx did also, but I may be
wrong.

> Furthermore the 68EC030 has some reduced MMU to control cacheable data accesses
> PS : BTW, the 030 has a subset of the 851 inside.
As I recall, it has a few things that the 851 doesn't have. I can't recall what they
were though. It's been a while.

A memory access though an external 851 added, at least, 1 cycle (per ATC hit), and for
the (030) there is no penalty.

The ATC (commonly known as a TLB) in the 851 is also larger than the on in the 030.
030 can hold 22 while the 851, from what I recall, held at least 2x that.

>
> In fact, there is two ACs registers AC0 AC1, whose role is similar to the TTx
>in 030's MMU.
> -> The assembler coding for registers AC0 and AC1 is strictly similar to TT0
>and TT1 on normal 030, which proves the fact.
>

Which proves that they are both similar, yet slightly different.?

> This MMU is called the ACU : Access Control Unit.
Nowhere in my 030 databook does it mention that, unless the EC is a newer derivative.
Either with more changes, or different terminology. (My manual is Motorola Copyright 1987)

My point is: these differences are relatively insignificant. With the speed of todays processors memory subsystem efficiency/speed is by far the most important factor. If the processor has to wait for the data, it has to wait before it can do anything with it.

Some of Sun's older 020 boxes were faster than some of the newer 030 boxes. At the same MHz,
same amt. of ram and paging, etc...
I believe one example would be the 3/260 and my 3/80.

Does this mean that VGA graphics on the IBM, with 256 for each RGB register,
(let's see 256 cubed is about 16.9 million) is not actually true color..
I notice (when messing with my friend's ibm) that when changing the RGB values, the colors change with most of the colors in dithered pattern! If it's
dithered, does that mean it's not the true color? So how many true colors are there on the VGA IBM?

I think you might have filled up your FAT's. Try using a formatter that allows you to expand the size of the FAT and retry the copy operation. There is a German program that allows you to do this. It is called Hyperformat, and it allows you to control almost all the disk format parameters.

>it over the Nintento, SEGA, NEC..

The Jaguar is supposed to be a 64-bit game machine... (a 32-bit game machine that was supposed to debut when the Super NES debut, was scrapped so that more
R & D will go toward the 64-bitter).
If it is going to have a price tag around $200, then it WILL sell!
And if Psygnosis is developing already, put my name down!

Why would I want to pay more than the cost of at TT to run programs just
as fast as a ST? I surely hope that it runs better than his Atari 8-bit
emulator "runs". Let's just say I don't have much faith in it actually
running as fast as an ST let alone a Mega STE. Well maybe the video
problems will be solved by the new graphic excellorators comming out from
DELL and Compaq y'know the ones which will allow them to actually run
NeXTPC in color and Windows at a speed faster than a slow crawl. (but the board
has to be designed to run them, you just can't add one on the bus, the bus *is*
the problem If the thing can't run Windows fast, it can't emulate a ST fast.
That pretty much leaves out *any* Intel box including the 50 Mhz 486.

Hey, it might be a dream to have NeXTStep running on a Falcon, but I still
think Gemulator is even more-so.

If I want an ST/TT I will buy one. If I want an IBM (why?) I will buy one.
The only emulator that I have seen that even worked halfway well is Spectre!
Dave Small is at least a competent hardware and software man. Darek is just
another Microsoft-lacky.

3361. Please post Megapaint Professional demo

Would some kind soul upload the Megapaint Professional demo (available on GEnie and CI$) to atari.archive? Thanks!

BTW, I've posted the Home Accounts 2 demo as someone requested. Look for "homeacc2.zoo".

Nifty! But does it support MIDI? Effeciently? It wouldn't really need to
emulate better than 8MHz ST speed, if it could handle MIDI in/out well.

This would be pretty neat, if possible. But an ST emulator that can't run
pro MIDI software seems kind of useless, except to DTP folks. I'm not sure
who else would buy it.

3363. Re: Formatting PC-readable disks on older STs

Newsgroup: comp.sys.atari.st
Date: 1992-04-06 23:14:55 UTC
From: ljdickey@watmath.waterloo.edu
Message-ID: <1992Apr6.231455.26319@watmath.waterloo.edu>
Source record: 223755

I wish that someone would publish a FAQ file with answers to
Frequently Asked Questions.

I would suggest these topics:

1. how to format floppies with older equipment
2. how to find atari archives (ftp and mail)
3. how to find other archives
4. how to download
5. which is the best terminal emulator for a beginer

And now to answer question number 1.

There are two fine programs for use on older STs that format folppies
in a way suitable for use on PCs. We use both of them regularly
around here. They are both small and complete. Try them.

PS2FORM
IBMFORM

Both are available at atari.archives.umich.edu .
There are something that the beginner should know about,
if he or she is going to use more than one floppy formmated on
an IBM PC, and that is that the internal soft serial number magnetically
encoded on a floppy that has been formatted on a PC might be the same
from one disk to another. This can cause you grief if you switch from
one floppy directly to another, because unlike the IBM PC, the Atari
goes to the bother of reading the serial number, and it might make
a mess of the second floppy thinking that you just took the same
floppy out and put it back in again. A simple minded, but sure fire
cure is something like double clutching: take out the ibm floppy,
put in your atari floppy, put in the second ibm floppy.
There are other cures for this, but that is not for beginners.

Source record: 223756

Hi there guys, I want to get hold of Calamus SL demo. Unfortunately I
am working from a Computer Science account of mine that has a pretty finite
limit (money wise) on it - so I can't FTP it easily.

I'd love it if someone could tell me where I could find a Calamus SL demo
with a mail_server to send it to me.

TNX in advance.

Cheers, Neil Gardner - New Zealand.

>
>I suggest you keep them around. Someone is bound to come up wiht
>a piggyback board with a switch so you can toggle between the two
>TOS's for compatibility purposes.
>

Im not too sure I understand. I admit that I do not know everything
about STs, so my posting may have been in error, but this is my
understanding...

520ST and 1040ST cannot upgrade to the 2.06 due to its larger
size, hence the reason for the TEC card. The TEC card essentially
maps the larger space of 2.06 into the small space of the ST.

Now for some confusion on my part. I have a late model 520 STe
(purchased in Jan 92), with the 1.62 set on 28 pin chips. But,
the sockets themselves are 32 pin, so I was able to install
2.06 without a TEC card

Is it a difference between the older ST and the newer STes?

With the Standard Atari Format, the base Directory can hold 112
entries, these are the entries that show up when you first open
the disk drive, ** Not what is seen with the Disk Info ** ..

Note: Disk Volume Label and any Hidden Files Do Count..

What is inside Subdirectores/Folders don't count as these behave the same
way as files..

There are some Format programs that let you set the Number of Directory entries
that you wan't, Hyper Format 3.2 is one that comes to mind..

I tried to E-Mail you but your path is incorrect..

Try a Golden Image mouse, they cost here some $50/60 nz, should cost
over there some $25us, they use micro-switches..

The later ones have a switch for Atari/Amiga, so try a Amiga shop..

I use a early Amiga one with 2 wires changed around.

Source record: 223760

John Ladasky:

The only machines that can run TOS 1.62 are either the 520STE/1040STE or Mega STE. Yes, the Mega STE will run it, we've tried it and it works. It's one of the few ways to make some games run on a Mega STE. TOS 2.0x isn't very friendly toward a lot of games, and TOS 1.62 is a help, but it's still not as friendly as good ole' TOS 1.4.

Source record: 223761

I don't see much point in GEMulator. I mean, for the cost of the board, plus the TOS ROMs for it, you can buy a used ST anyway. If you want to run ST stuff faster, get an acclerator for the machine. The reason the screen update is so slow on PC's is because of their inferior technology to the ST, Mac, and Amiga. PC's are junk. Period. So what if they have ten times as much software. All but the latest is pretty lacking in quality, and even the newest stuff is ages behind the best stuff for the ST. Look at Pagestream, Calamus, DynaCAD, Avant Vector, etc.

I don't mean to sound quite as 'flaming' as I do, but I really don't like Darek's attitude. Ever since he released ST-Xformer 2.55 (the 8-bit emulator), he included a text file with it flaming Atari and saying he'd had it with them and everything. He said he was going to make an emulator for PC's, so when Atari is dead and gone, people can still run ST stuff.

I think that if Atari did fold up, not many people would care to run ST stuff anymore. Just the old diehards, like the current 8-bit users (I'm one) might consider it neat.

I just don't see the point.

Your personal opinion of Darek says just about nothing about the fact that
the Gemulator is a fact. The only problem I can foresee is him finding
enough people to back him in such a seemingly useless project. Why would
a 486 owner want to emulate an ST? There is not one single application on
the ST which I EVER use...except for those which I run within Spectre. Which
by the way, runs (or is very close to running) under Gemulator.

Sorry, but the ST has dropped the ball. Forget it.

I can't agree with you. Golly, real applications like OS/2? Boy, there's just tons of stuff coming out for that. As far as the video being serviceable, from the specs I've seen so far, that's an "idiot's fantasy".

Please correct me if I'm wrong, but as of Branch Always Softwares press release, the GEMulator will "never" handle MIDI. So, the video stinks, the MIDI is non-existant, and you have to buy a $3000+ machine (the newsletter says ideally a 486 50mzh) to emulate a $300+ machine.

If for some reason an Atari owner needs an IBM, they may as well keep their machine. (I kept my 8-bit...)

As for his 8-bit emulator credentials... I must say, it works about as well as the Amiga emulator does.

I'm just tired of all this free advertisement (from people on a first name basis with him) for a product that doesn't even work properly yet (AS PER HIS OWN NEWSLETTER).

I rather prefer having two systems running side by side... But I can see
quite a bit of incentive JUST to run a powerful package like
Calamus. The cost of an equivalent package on the PC can be
more than the cost of Calamus + Gemulator but I'm guessing.

>>emulator "runs".
>

Xformers is nice as far as emulation goes. I was surprised that
Darek could emulate the 8bit video hardware on the crappy
ST graphics hardware as far as he did. Even to the point
of running some games/demos. I thought that he could
have done much better on the overall design of the
emulator, however. If it weren't for a couple of
inconsistancies in the user interface and the awkward
handling of XFD [SD???] files, esp. with the support
software. For instance, the utility that transfers
files from/to *.sd images won't bother with *.xfd
filenames [why did he even bother checking yet still
allow the user to change the file list mask].
Why not use a standard file selector, anyway?
Why not use the same random access code in Xformers to
transfer files instead of loading the whole image in
RAM! Or better yet, why not integrate the transfer
code WITHIN Xformers. These are things that could
have been done quite easily by him.

>

I'm kind of confused by this. Shouldn't Darek have two operating
for his emulation? Direct bitplane conversion is very slow and
takes up an unacceptable amount of cpu time. If you have used
a mono screen emulator, you would know this. Also, most
ST software that does direct writes to screen memory would
most likely never work on Gemulator at all, anyway, as they
bypass other OS functions [granted, this <IS> the best
way to program]. But, a more logical way would be to emulate
VDI calls... Replacing GEM VDI calls in x86 assembly
would also allow software like DynaCadd to function on
1024x768 SVGA monitors.

>completed, but NeXTStep for the Falcon is some idiot's fantasy.
>>

hehehe! Actually, NeXTStep for Falcon doesn't sound like such a
pipedream. Hasn't NeXTStep been ported to IBM workstations?
The operating system is running on a device-independant Unix core
so why not? It's well within possibility. Aside from all
legalities... d:^)

>

I respect Darek Mihocka for all the work that he hasn't been
sufficiently rewarded for. Especially for that crap that
those BRE scum pulled on him over his Xformers cable. From
the software that I've seen from him, he doesn't seem to
me as a perfectionist. But I've seen little.

There is, in fact, some excellent applications software that is
are available on the ST. Particularly midi applications such
as CuBase or Virtuoso. Calamus seems to still only be available
on ST machines. I would imagine that the 3D animation software

for the ST is infinately superior to any like-priced IBM
package as goes with just about everything else.

Dear Mr. Dhir,

Question how in the He** are you supposed to run Spectre without the Spectre Cartridge (or more appropriately the Mac Roms it contains)? Maybe run the pirate file versions of the Mac Roms like Darryl Microsofts running a pirate version of TOS?

Bet Apple would really like to hear that. Put my name on the list of people that say good riddance to bad rubbish, glad to see you leave the ST world, Darek.

P.S. I have to deal with an IBM enough at work why would I want to drag one of the dam* things into my house.

if you have a double-sided drive on the Atari, just format the disks on
a PC as normal 720k disks. The Atari will have *no* trouble with them.
If you have a single sided drive, the person with the PC needs to add
the following to their CONFIG.SYS (assuming the 3.5" drive is drive b:)

device=driver.sys /d:1 /f:1 /h:1

This creates a "new" drive letter for the B: drive and tells the
system that it is a single sided 3.5 drive.

This all works because the Atari uses MS-DOS directory structures!
The only catch is that DOS requires the first sector after the index
hole to be sector 1. The Atari ignores the index hole. That's why
you need to format the disks on a PC...

I "converted" files to PC format for a friend with an Atari for
years. His editor never complained about the disks with the manuscripts
on them...

This does bring up the question. Just *how* does/would Gemulator run Spectre? I think running Spectre without the Spectre cart just might be against Dave Small's wishes. Can you even buy a copy of Spectre without buying the cart?

Also note that reading the MacRoms into memory is illegal unless you do it *every* time you start the emulator. Copying them do disk and leaving the ROMs on the shelf is not legal (as I understand it).

Was the demo of Gemulator running off a TOS board? If not, *that* is illegal.

It won't run video at ST speeds no matter what speed the chip is at unless maybe you have an EISA bus (which those cheap clones arent) or its one of the new direct mapped video models which start at $5,499 for a base line Dell. And you *can't* upgade to one, it on the board not the bus.

Pay lots of money, have to get a board to hold TOS (and waste a slot), not run MIDI aps, have slow video, and still have performance under question. And I don't expect it to be able to *legally* able to run Spectre. That's just marketing bullsh** for all I know till I hear how they will do it.

I still don't get it! Who'd buy Gemulator, and if someone did, should they be commited?

>ost all the disk format parameters.

Another possibility is that he tried to put all those files in the root directory. The root directory of any MS-DOS disk can only take a limited number of files, I believe, since it retains compatibility with the original flat file system of some early version of DOS. Since the Atari file system is compatible with the MS-DOS file system, it shares the same limitations. Try creating a folder on the floppy and copying the files into that folder. Subdirectories are files and are only limited in size by the media size.

You might get around it by reformatting the disk and setting up the boot block to allow more directory entries in the root directory, but it sounds like a pain.
So I need a signature....

3382. 50Hz Spectrum picture viewer wanted

Newsgroup: comp.sys.atari.st
Date: 1992-04-07 08:58:57 UTC
From: mro@dcs.exeter.ac.uk
Message-ID: <5978@izar.dcs.exeter.ac.uk>
Source record: 223774

I have downloaded all the Spectrum picture viewers I can find on atari.archive and have yet to get any to work properly. When viewing a picture, the screen starts to roll in the same manner as when 60Hz mode is selected. I presume that due to the special timings necessary, these programs are specifically for 60Hz systems. However, I am trying to view them on a TV set, which will only run at 50Hz.

So, are these viewers dedicated to 60Hz pictures, and if so, are there any 50Hz viewers available?

Thanks

Marcus

Thanks for the post. I've been considering buying this. I saw it in a shop
the other day but was kind of shocked to see that the label on the Amiga
version boasted hard disk support but the ST one didn't. Mind you it did not
say "Hard disk not supported" like another Microprose ST package.
Copy protection was also a limiting factor. 35 pounds would be quite steep if
you couldn't back it up.

Speaking of HD support, of the seven or so Microprose packages that I looked
at, all of them supported HD's on the Amiga but only two on the ST. These
were Silent Service II and Knights of the Sky. The feature list of Knights of
the Sky said that playing via modem ports was only available on the PC and
Amiga versions. What gives? I see no reason why ST versions can't have HD or
modem support. Paranoia would lead me to believe there was plot here.

Starting to dominate? I can only speak for the UK, but here Atari dominate the music industry right now. Mac's are just too expensive for UK musicians and the Atari's built in MIDI port made it number one choice from launch.

Successful acts like New Order who have pots of money use Macs now, but for your average struggling muso/engineer/mixer whatever the ST is king.

Mac's have the best HIGH END music software however (SoundTools) and the developers of CuBase (?) have stopped working on the ST in favor of the Mac.

I think LC's will have to become significantly cheaper to penetrate the music business here. The PowerBook could have done very well (again with those with big money) but apparently MIDI is screwed up on it... shame.

Howdy...

I just finished installing tos 2.06 in my machine and was wonder if anybody out there has a file explaining all the new and wonderful fixes. I used to have 1.06, so I hope there are a few fixes... ;-) It was a pain getting the jumpers out to resolder them in the right place. But all seems to work just fine and dandy. I have noticed one problem, I cant seem to get Maccel3 to run? It just gives me a lot of bombs across the screen. Also, what fixes do I need in my auto folder now? Do I need turbocts/tos14fix? Or poolfix? Please reply via email and I will summarize to the net.

No, it cannot be that the FAT if full !!! If it were, than it would mean there is no more space left on the disk anyways. It's just that there is a file limit per directory. The value is 70 (hex) if I'm not mistaken. This value can be changed (Byte 17 or 18 of the boot sector), but I'm not sure TOS will take those changes with a smile (It might try to allow more files, but doesn't have the memory allocated for it, so BOMBS away :-), and even then, GEM will not accept it in its File Selector ...)

>you need to format the disks on a PC...

I'm sorry, but this is totally wrong. The only reason that one had to format the disks on the PC was that the older TOS versions didn't write the boot sector in a 'compatible enough' way.

The ONLY thing required to make ANY ST DS DD 720 K disk PC-compatible is to get a sector editor, and change the jump instruction in the first three bytes (from "60 xx" to "EB xx xx", I use "EB 34 90"), and fix the media byte (the first byte in the first sector of each FAT, usually found on sectors #1 and #6, counting from 0) by changing it from F7 to F9 (all numbers in hex).

Of course, if you format your disks on the ST with one of the modern formatting tools, the program does it all for you.

I recommend MDISK, which is a clever combination of RAM disk/copier/formatter accessory. It's free, and can be ftp'ed from varios atari servers. It's also included with the CS-TeX package.

There is a GOOD reason not to use a GEM Window. The first reason, which
you mentioned, is that the speed is VERY slow. Even with accellerators,
the output can't keep up with more than 2400 baud in Stalker. Without an
accellerator it would be hideously slow. Also, a GEM window takes up
space. Instead of 25 lines (24 with a status bar) you would have 23
lines and be forced to put the status bar at the top of the screen.
There is also the added joy of having to handle more complex redraws.

No, a window is not the way to go for me. The mailer and newsgroup
machine was not working regularly, so I think I missed a lot of this
thread. I did find out one way to shorten the screen. Subtract 1 from
the value contained at $2AB2 and you have a shorter screen. Add 1 when
you want to update the status bar. It was as simple as that. At least
for monochrome. I'll have to try it with color as well, since I am not
sure if the address applies to all ST machines.

Hello!
Is there anyone who could give me information about the Atari STBOOK?
I consider to use it mainly for telecommunication.
Do you have articles or reports and infos about the price in Europe and USA?
Please post your mail either to the list or to the follow adress:
k111118@alijku11.edvz.uni-linz.ac.at
thanks Walter Birklbauer

Mark,

The machine was shown to deverlopers and press at the Toronto show last weekend, so it does exist. I've seen it personally, naturally, since we publish Atari Interfaace magazine! :)

You have a hell of an annoying attitude. It is truly unfortunate that
people like you exist in these threads, it makes it difficult to have an
adult conversation on the Usenet.

In any case, to answer your question, the Gemulator board that contains
the TOS Roms actually has two empty sockets for the Mac ROMs.

I have a rather long article on the Gemulator, I'll send it up for you to
look at sometime later.

Go kick a dog or something.

Actually the Local Bus motherboards don't cost much at all. You can get a 486/33 Local-Bus with 8mb RAM, 200MB HD, and a 14" SVGA card/monitor with DOS and Windows for $2750. Look through the new issues of Computer Shopper. Great deals.

Peace.

Source record: 223786

Help !!! Help !!! Help !!!
Is there anyone using ALADIN 3.0 on the ST??

Is there anyone who has experience with the horrible FRANKIE virus-infection??
The FRANKIE virus begins his work after about 15 to 30 minutes. There is a
message: " Frankie says: no more piracy" and the system crashed. After that time
you usually changed a few discs and the virus is everywhere and you have to
clean up the whole system.
Is there any ANTI-Virus for this bullshit FRANKIE-virus on ST available.

please answer

3398. Re: New rumor about Atari Falcon and NeXT

Newsgroup: comp.sys.atari.st
Date: 1992-04-07 19:16:21 UTC
From: exuhag@exu.ericsson.se
Message-ID: <1992Apr7.191621.16064@exu.ericsson.se>
Source record: 223789

Some relatively subdued comments amid the hype and flames:

* Remember that Atari Corp. has track record of not coming through on their promises or finally delivering on them way too late.

* The hardware of the so-called Falcon is not nearly as important as the software. If people could have a solid little machine that ran the applications they needed without having to learn all sorts of arcana, then they would be happy.

* NeXT step is one of those issues that doesn't matter. Sort of like the myth that all video game system owners want to upgrade to computers and the fabled checkbook management and recipe database programs. It sure doesn't sound like Atari is going after the workstation market, especially if a trimmed down Falcon will be marketed as a game system.

* The price had better be damn low on whatever computer they finally release. The STs big advantage in 1985/86 was that it undercut everyone else in terms of price. That advantage only lasted about two years though. Let's say the Falcon checks in at an unbelievable $1000 including color monitor. That's still not low enough to drag people away from well-supported machines with lots of available software.

>In any case, to answer your question, the Gemulator board that contains
>the TOS Roms actually has two empty sockets for the Mac ROMs.

Well that relieves *some* of my questions. How does it read Mac Disks? It would be enough if it could read 1.44 disks (that is as soon as Dave adds the capability), but I don't see how you can make a typical IBM read Macintosh disks without some extra hardware device (of course I am not a hardware-techy type so I could be wrong).

It just seems to me that for a $300 program on top of a $2500 machine which you need to buy some TOS chips to add, just to emulate a $350 computer is just a little out of whack. Some might want it to run Spectre but that still gets out of line: $300 + $500 (Spectre w/Roms) + TOS comes to $800 plus to emulate a mac (but probably faster than a plus speeds). I guess some might pay any price to be able to run mac apps on an IBM, but we are close range of just go out an buy a real mac so you get Sys7, all the proper ports and such, the possiblility of color, et all. Well, I guess someone will buy it just to be able to do that.

But hey, I guess it's a good add for an ST. It takes a 50Mhz 486 just to be an ST (without MIDI). Hey, how is Gemulator on ST sound anyway?

Ted Brown (still trying to get "it")

Well, they read and respond to people in the Atari ST Roundtable in GEnie, which, by my estimation, has three or four orders of magnitude more participation than this notesgroup. It's also where most of the commercial (U.S.) developers can be found, if they can be found on an electronic media. My point being, I don't think there's any shortage of feedback arriving at Atari's doorstep, from the full spectrum of novice users to developers. (No shortage of whiners, either, but the GEnie sysops are effective at eliminating base note drift, so it is much easier to ignore them, and that alone justifies the cost of GEnie in my book).

Disclaimer: These are my own opinions, and I'm not affiliated with GEnie, et cetera.

3402. Atari Buying Up Good Software?

Newsgroup: comp.sys.atari.st
Date: 1992-04-07 20:20:56 UTC
From: andyc@hplsla.hp.com
Message-ID: <5440178@hplsla.hp.com>
Source record: 223793

The past week I've read (on GEnie) that Atari has purchased SuperBase for the ST from Oxxi, Inc (which bought it from Precision Software, the creators of the program). Also, I read that Atari bought LDW Power (from LDW). In both cases, the story seems to be, upgrades are no longer available from these companies for these programs, and no one seems to know what the deal is.

Let me clarify this: the above information comes from people that have called these companies to inquire about upgrades, and posted what they were told on GEnie.

So: what's going on? Is Atari going to find a nice home for these programs (which are arguably among the top productivity applications for the ST)? Can we look forward to future enhancements?

Inviting speculation, positive or negative, BUT.... please post blatant pointless whining elsewhere!

(And, of course, if anyone knows that these rumors are false, PLEASE correct them!)

Disclaimer: I have no fiduciary interest in any of the companies mentioned, and I cannot vouch for the accuracy of these rumors!!!

>extremely high... on the order of 99 gazillion..), the human eye
>no longer can tell the difference between the computer generated
>image and a "true" photographic image.
>

Eight bits per color is certainly as good or better than typical video systems. Production quality video cameras (including HDTV types) typically have a dynamic range of 40 to 50 dB in each color channel. High-quality CRT and projection displays are little better. Eight bit channels have a signal-to-noise ratio of 49 to 50 dB. Only very specialized systems would need more than eight bits per color channel.

-- Scott Willingham // willing@icsl.ucla.edu

p.s. I suspect that "true color" refers to direct storage of RGB values in video RAM as opposed to the use of color palette lookup tables.

(1.) Can someone out there furnish Atari's address & phone number?

(2.) Have any netters used the Portfolio? I'm trying to compare it to the Sharp Wizard as an all-purpose organizer & PC-adjunct.

Thanks... Jim.

3406. MiNT Mouse

Newsgroup: comp.sys.atari.st
Date: 1992-04-07 21:49:24 UTC
From: "J.J. Lehett" <JJL101@psuvm.psu.edu>
Message-ID: <92098.174924JJL101@psuvm.psu.edu>
Source record: 223797

Well, I took the plunge into MiNT last night, got it and MGR up and running, and have a few questions.
1. The mouse was very hard to control. Is this normal? It would sort of lag behind my movements, then catch up , and just be very ornery about things.
2. In mgr, I was able to get font to change the fonts, but browse kept on saying there were no icon files found, even though I explicitly stated the path to the icon folder. Any ideas on this one?
3. I am not sure what I am missing to get mgrterm to work. It simply does nothing on my screens window where I run it. I am not exactly sure what to do with TERMCAP and the like, any help here? I am using the init, and init.rc from Mr. Pratt's file, and changed the drives in the .rc to reflect where mine were, but did not see anything concerning TERM orTERMCAP in them.

Basically I would like to be able to open a window in vt100 mode to connect to our vm/cms system here, and the unix boxes, but I HAVE to have vt100 for the 3090. So, basically, IS there a term for mgr to handle this, and if so anyone care to go through what I need to do to get it to work?
4. Editors, well, I have used vi, micro-emacs, etc, but would anyone have any reccomendations on which ST editor I should use in mint and mgr?
5. Same question as above but with shells, as I said, using init right now, but could use bash tcsh or ksh, but would like to hear reccomendations from folks out there before going through the hassle of setting them all up and testing.

And finally, anywhere out there have even further docs on mint and the utils for it, other than what is included in the package?

Thanks in advance!

I am looking for someone with VME and OS-9 experience who is
interested in doing a summer project, Ph.D or postdoctoral research in
Neurophsyiology. Prefer someone willing to help convert real-time lab system
(from PDP/11 forerunner to VME) in addition to research on vision, spatial
orientation and attention. Tentative plans are to use Ataris and Amigas but
also considering real (real expensive that is) VME vendors.

Ermutigung fuer alle die mit Atari-VME interface erfahrung haben.

3413. Floppy drive mystery

Newsgroup: comp.sys.atari.st
Date: 1992-04-08 00:56:43 UTC
From: azog@thoth.rent.com
Message-ID: <1992Apr8.005643.492@thoth.rent.com>
Source record: 223854

The following started happening to me after I installed a hard drive on my STe, but first, some background...

This is a 520STe with 4mb of RAM, and TOS 2.06. The hard drive is an ICD AdSCSI Plus controller card, with a Seagate ST-225M (I purchased each seperatly and built my own shoe-box for it)

So anyways. Every now and then, when I try to access the A: drive, I get an error message Drive A: Does Not Exist. Damn straight it exists, its internal, how could I remove it? Usually a soft-reboot fixes it up. The other problem is in trying to read the B: drive (SF314), it asks me to Put Disk B: In Drive A: (or some such drivel,) and when I answer the dialogue box, it reads drive A: not B:. Again, a soft reboot usually fixes it.

Its not really life-or-death, but it gets to be annoying... One thing is that mostly it happens on power on, when it boots off the hard drive. I guess since it doesnt see the floppy during boot, it assumes it doesnt exist? Which is a bummer, because Ive got that program No Roach on the floppy, that lets me set the boot delay time.

Ive noticed that the floppy access lights (both) of them blink dimly at a rather quick rate. But they no blinken when the above happens. (btw: as an aside, just what is this blinking anyways? It did the same thing on a 520STfm that I had, but I thought it was just my imagination. Is it some kind of heart-beat?)

So anyways. Does anyone who has a similar setup have these kind of odd happenings too? And how can I stop this?

Thanx

If you read the Frequently Asked Questions list for this newsgroup,
you'll find that it's "stzmagazine-request@virginia.edu".

3415. DIARY.ACC need at atari.archive.umich.edu

Newsgroup: comp.sys.atari.st
Date: 1992-04-08 02:55:25 UTC
From: swood@vela.acs.oakland.edu
Message-ID: <14612@vela.acs.oakland.edu>
Source record: 223856

I just was looking through the atari archive at umich, and I was noticing that the edhack.acc editor package is supposed to contain a file that is called diary.acc. If anyone has this file, could they please either forward it to me, or to the atari archive so I can add it to the package.

thanks

swood

Well, it's not plain-old TOS any more, it's TOS with MiNT extensions. It sounds to me like it'll be a pretty good system, especially good for porting BSD Unix apps.
>
>From what I've seen of the ST world, it is very

>overly concerned with backward compatibility.

None of the above-mentioned things really have anything to do with backward compatibility or revision levels of anything. Machines with a blitter are still driven by the same graphics calls as machines without. Machines with monochrome displays are driven by the same routines as color, etc...

>you need to format the disks on a PC...

Not true.

Follows is a program I wrote way back in 85, to convert Atari DS disks
to a format the PC can read. The problem is that MSDOS expects a jmp or
jmp short in the first byte of the boot sector. This program also fixes
up the bpb.

```
code segment byte public
assume cs:code,ds:code

org 100h
atari proc far
start: jmp short over_data
sigon db 'Atari ST -> IBM disk patcher',13,10
db 'Copyright (c) 1985, Timothy Purves',13,10,'$'
err_msg db 'DISK ERROR!',7,'$'
mode_flag db 0

over_data: push ds
pop es

mov dx,offset sigon
mov ah,9
int 21h

mov mode_flag,2
call diskio
jc error_out
mov word ptr [bx],34EBh ; short jmp
mov byte ptr [bx+2],90h ; nop
mov byte ptr [bx+15h],0F9h ; media type
mov byte ptr [bx+200h],0F9h ; Fat ID
mov word ptr [bx+201h],0FFFFh ; Fat Marker
mov mode_flag,3
call diskio
```

```
mov al,0
jnc normal_out
error_out:
mov dx,offset err_msg
mov ah,9
int 21h
mov al,1
normal_out:
mov ah,4ch
int 21h

atari endp

-tpurves

diskio proc near
mov cx,5
retry: push cx
mov ah,mode_flag
mov al,2
mov dx,0
mov cx,1
mov bx,offset disk_buffer
int 13h
pop cx
jc reset_disk
or ah,ah
jnz reset_disk
ret
reset_disk: xor ax,ax
int 13h
loop retry
stc
ret
diskio endp

disk_buffer equ $
code ends

end start
```

>Why, you just run Sudden View using Darek Michoka's GEMulator on any fast
>MS-DOS machine, right?
>
>All sarcasm aside, the GEMulator sounded like a real stupid idea in the
>first place, but do these comments of Rod's mean that the GEMulator can't
>possibly work as advertised, and is really pretty much worthless?

Ok, let's put these stupid speculation about how "Gemulator can't
possibly work" to rest once and for all. Last weekend Gemulator
was shown to over 2000 Atari ST users at the ACE show in Toronto.
It was seen and tested by Bob Brodie, Charles Johnson, Dorothy Brumleve,
Mike Vederman, and many other ST developers, including Rod Coleman the
developer of Sudden View. Sudden View worked as did 100% of the programs
that were tested on Gemulator (including Pagestream, Calamus, Dynacadd,
Tempus, Laser C, GFA Basic, etc). Rod was even impressed.

If anyone would still like to claim that it is impossible to emulate
the 68000 and ST hardware on a PC with 100% compatibility, please
explain. Obviously, 2000 people just imagined they saw it work.

Ted Brown questions the usefulness of emulating a Mac on a PC...

There already IS a Mac emulator board for the PC. It costs on the order of $1000 and requires you to insert genuine Mac ROMS, just like the Spectre. It "wastes" a slot, just like the GEMulator would (what does "waste" a slot mean..? A floppy controller card "wastes" a slot, as does any card you WANT to use...)

You have to add the cost of Mac ROMs to the $1K pricetag, and yes, apparently people want to run Mac apps on PCs enough to pay the price.

There is also an Apple II emulator board for the PC. I don't know how much it costs, as it came with my wife's PS/2 from the school she teaches at. It loads Apple's DOS from disk, and allows you to attach a genuine Apple disk drive to load Apple software. Ironically, it also uses a very "ST Xformerish" method of storing Apple software on the PCs native drives.

Who needs it..? Not I, but apparently enough educators want one to make it a viable product.

Who needs a GEMulator..? Again, not I.. but that doesn't mean no one else will buy one. And really, who cares..? It can be done, and be done legally, so I really don't see where the problem is...

This cannot be true. The FAT is just large enough to contain pointers to all sectors of the DISK. In general I have some doubts about attempts to do strange formatting things. A number of
responses to this mail state that the problem is in the size of the root directory. For mysterious reasons this size is fixed. For subdirectories this restriction does not hold.

That would install a new driver. In my CONFIG.SYS file I have the following:-

drivparm = /d:1 /s:10

which modifies the parameters for drive B: to accept 10 SPT disks. Curiously
it also lets drive A: read them too if you only have one floppy.

> He thought it was uploaded - there may be some sort of
> bottleneck at SOME point... Archive maintainers should maybe take a
> look around and see if GCC 2.0 is maybe hiding in a subdirectory
> somewhere!

Perhaps this is my fault for not publicly announcing my withdrawal from assisting the administration of A.A's gnustuff. Over the last 12 months I have tried to rationalise the gnustuff archives and bring them up to date. By and large this has been done.

The amount of effort required to maintain the currency of the s/w is beyond me and I dropped out of the loop several months ago. Since then, the only GNU s/w which has been added to A.A. is that which other folks have u/ld.

I have a long-standing request from a fellow Brit for the GCC suite on cart tape, so I decided to update my copy of GCC when 2.0 came out. I d/led the s/w from A.A., applied ++jrb's updates (14->19) and compiled up the binaries with an HP-hosted cross-compiler. I've been doing this at my own speed during lunchtimes and it's very little additional effort to package up the updated sources and resultant binaries and u/l them to A.A., hence my recent posting on the subject. *But* that's as far as I intend to take it.

I hoped to u/l some of it this week but I had to fly to Stuttgart on Monday, spent Tuesday in Stuttgart, am writing the trip report today, have all Thursday a.m. scheduled for a meeting, Thursday p.m. for urgent admin work (expenses from Stuttgart, etc) and on Friday will need to get on with deadlined project write-ups. As you can see, there's little time left for pratting about with trivialities such as s/w for my home computer. Hence the delay chaps, sorry and all that but ... I'll see what I can do during lunchtimes.

Cheers,

Anybody who has more news on this widget, now or in the future (especially
those going to the show), let me know!! I've got this 486 at work and it
would be great to emulate an ST, simply to run all the software I've
developed - would save a lot of porting time.

And as I said before a lot of people might find it cheaper to buy a
386/496 rather than buy a TT.

3431. Lattice C timer routine problem

Newsgroup: comp.sys.atari.st
Date: 1992-04-08 11:27:06 UTC
From: strgh@warwick.ac.uk
Message-ID: <wzghb63b@csv.warwick.ac.uk>
Source record: 223872

(NOTE: this may not be a specifically Lattice C problem).

I want to time some calculations to the nearest second rather than
to the nearest 2 seconds (which seems to be the resolution of all
the library time routines).

I used vex_timr() (spelling?) and a trivial rewrite of the example given in
the Lattice C manual to update a global variable every second, but when I
ran it I got "Stack space exhausted - program aborted - 3 (usually) bombs"
message.

** The same thing happened when I typed the example program in verbatim **

I've tried changing a few "int"s to "short"s (since the Compute! Tech. Ref.
Guide seems to contradict the Lattice C manual), with no joy. Be warned
that I am a GEM neophyte.

Can anyone help? I'm using Lattice C v.5.06.02 on an old 1040STF with TOS1.0.
Many Thanks.

3433. Re: New Graphics Card: Spektrum

Newsgroup: comp.sys.atari.st
Date: 1992-04-08 13:38:40 UTC
From: hintz@gulliver.informatik.uni-dortmund.de
Message-ID: <6352@unido.Germany.EU.net>
Source record: 223874

The Spektrum Graphics Cards where developed by

Wilhelm Mikroelektronik
Luenen
Germany

At the moment are three different types of cards available:

Spektrum 1 with 256 colors out of 16777216.
Spektrum 1 HC (HighColor) with 32768 colors. (5-Bit each of
the Red,Green Blue channels.)
Spektrum 1 TC (TrueColor) with 16777216 colors. (8-Bit each of
the Red,Green Blue channels.)

The Spektrum 1 HC can also display 256 colors.
The Spektrum 1 TC can also display 32768 and 256 colors.

The cards are shipped with GEM-VDI-Drivers.
All clean GEM-Software runs:
Gemini, Turbo-C, Interface, Harlekin 2, Charly-Image, GEM-View etc.

All three cards are designed for the VMEbus. For the MEGAbus is an adaptor
available. The cards have 1 Megabyte videomemory on board.

This is not intended as a flame, I just wanted to point out that there
are some programs that won't work, but of course nobody cares!

What about all those demos? Timing-sensitive programs etc.
Don't tell me the Union Demo will work!!!

Anyway, don't take this posting too seriously, don't flame me!

I haven't seen GEMULATOR but I believe it works fine, it's just that
it will never COMPLETELY replace a "real" ST...

Darryl Microsoft??? egad, some people are really ignorant.

seems like you were not at the show. too bad, since darek would
have explained (quite pleasantly, i might add! :-)
to you that the Gemulator will be sold with a PC ROM board
where you will plug in Legal TOS roms. In fact, he is
right now working on a deal with Atari to have Atari supply him
with TOS roms to plug into his Gemulator so that the final
product will come ready to run GEM, TOS, etc.

As for Spectre, the board which holds the TOS roms can be made
with two more rom sockets (mapped in at 128K below the
TOS roms - hey, JUST LIKE A CARTRIDGE PORT!) where the Mac Roms
can be plugged into. And voila, run the Spectre code, and you should
be emulating a Mac just like that. And if Spectre is legal if you
purchase a Legal copy of the Mac roms, then Gemulator will be legal
if you purchase the Mac roms. period.

>
>Bet Apple would really like to hear that. Put my name on the list
>of people that say good riddance to bad rubbish, glad to see you
>leave the ST world, Darek.

seems people have a problem with Darek and his "attitude", but
lets face it: he is a developer, not a marketing person. If people
are interested enough in the concept behind the 68000 Emulator
then he may
(or should) get a PR person to handle the marketing of the
product. then people don't have to deal with him directly!

I went to the University of Waterloo (and so did Darek
by the way), and I know first hand that a) we did not have
enough 68000 breadboard kits to do developement work whenever
a class needed working 68000 code, and b) since the engineering
network is a PC network, it would be quite nice to add the
68000 emulation software to that network, so that EVERYONE

will have access to a 68000 emulator, not just the people
who have to do a project for that class.
Engineering schools should be very interested
in this idea, since engineering and programming classes can use
the 68000 emulator rather than the usual Motorola 68000 breadboard
kits that most schools have for 68000 projects. This will save
time and money since hardware will no longer have to be purchased
and maintained.

if people have a problem with his attitude, so be it. Don't
let it detract from an excellent job in software engineering,ok?

>
>P.S. I have to deal with an IBM enough at work why would I want
>to drag one of the dam* things into my house.

some people, like myself, are FORCED to use PCs at work due to
company "standardization to a single platform". So for people
like us (and i would hazard the guess that the majority of
people out in the world are subject to stupid company rules
such as these) having a software/hardware combination that
allows us to run our favourite software from the atari world
on a PC makes at least me quite happy. i'll be using the emulator
more than i would use windows, thank you very much.

and since i have a 386 machine at home, as well as a 1040ST,
i will be able to boast that i have TWO 1040ST's in my home.

wow! i never thought i would come to Darek's defence so easily,
but when a piece of software technology as impressive as the
Gemulator is being dismissed because of the programmer's
"attitude", then it's time to come to the defence of the
software technology.

oh, btw, i saw the ST Book at the ACE show. neat! very impressive
little product, except (and there's always an exception) for the
LCD screen. It was simply, UNREADABLE. far too faint. you can't
see anything if you not directly in front of the screen. that
part of the Book MUST be improved if atari is going to sell any
of these things. My first impression was "hey, this is
neat", but after using it for a few minutes, i decided, "i
wouldn't buy this thing because of the screen".

Martin> My personal experiences:
Martin> For an effective multitasking the old ST is too slow, and the
Martin> resolution of the good ol' SM124 too poor.

COME ON NOW!! Is this true? A Sun-3 has approx. 75 pixels/inch and a
SPARCstation has 99.19 pixels/inch (both std. monochrome monitors).
Now the SM124, on my machine, has approx. 80-90 pixels/inch.

This seems a quite correct resolution in my book!

3444. Tiny Turbo and IBM software emulator question

Newsgroup: comp.sys.atari.st
Date: 1992-04-08 16:21:47 UTC
From: gibson@lambda.msfc.nasa.gov
Message-ID: <1992Apr8.162147.20813@lambda.msfc.nasa.gov>
Source record: 223884

My wife wants to use Word Perfect 5.1. I was wondering if I could buy a tiny turbo and then run an IBM software emulator on my MEGA 4 ST. I bet it would be the fastest 8088 around. Does anyone know if I can do this? If I can then what is the name of a good IBM software emulator?

3445. Want OS9 disk driver for Atari ST/Supra

Newsgroup: comp.sys.atari.st
Date: 1992-04-08 16:53:17 UTC
From: wmb@pi.Eng.Sun.COM
Message-ID: <ku697tINNhn3@appserv.Eng.Sun.COM>
Source record: 223885
Cross-posted to: comp.sys.atari.st,comp.os.os9

I have an Atari ST with a Supra hard disk drive. I have OS9 for
the machine, but it only works on floppy disks. I can setup the
hard disk partition table using the OS9 FDISK program (which runs
under GEM), but when I try to format the hard disk under OS9
(format /h0fmt), the system hangs. It appears to be waiting for
an interrupt or something.

Does anybody have a modified driver that will work with the Supra drive?
(well, actually it's the Supra controller that appears to be the
problem; I have tried both the original Miniscribe drive and a newer
Quantum drive, both to no avail)

Alternatively, does anybody want to sell me an Atari hard drive system
for cheap?

Please respond directly via email, to either:

Mitch.Bradley@Eng.Sun.COM
or
forthware.uucp!mitch.bradley@auspex.com

Thanks,
Mitch Bradley

3446. Re: Networking software for ST

Newsgroup: comp.sys.atari.st
Date: 1992-04-08 16:53:59 UTC
From: pm@fortec.tuwien.ac.at
Message-ID: <pm.702752039@fortec.tuwien.ac.at>
Source record: 223886

In <pm.701722127@fortec.tuwien.ac.at> pm@fortec.tuwien.ac.at (Peter Mayer) writes:

>Hello,

>some time ago we purchased a "Riebl-Card plus" ethernet card from Atari
>to connect our Mega-ST to our LAN.

As we were interested in networking between computers of different brands
we built our own telnet and ftp based on the ANS GEMDOS extension
specifications. The performance of the ANS services seemed to be very poor
(ftp transfer rate) so we decided to implement a new TCP/IP kernel.
To allow for several concurrently running applications we use the builtin
pseudo-multitasking capabilities of the AES.
The interface to the hardware is accomplished by a "Packet driver" with
an API modeled similar to the "Packet Driver Specification" for PC network
boards so the hardware layer is completely insulated from the network layer.
All the programs are written in PURE/TURBO-C with few lines of assembler in
the Packet driver.

We do not plan to integrate SLIP support into our TCP/IP implementation, but
it could be done easily by replacing the ethernet "Packet Driver" with one for
the RS232. Besides that, there is the KA9Q package available in the archives
which supports SLIP.
For all we know the Riebl-Card isn't very common (and cheap).
Therefore we started to think about using one of the parallel-port-to-ethernet
adaptors available for PCs (e.g. Xircom). If you know the specifications of
such beasts please mail.

The TCP/IP kernel is implemented as a resident program, which hooks into
the GEMDOS trap. Common TCP/IP parameters (default gateway, local
internet address, size of buffers, ...) are configurable by a resident
data structure accessible via a cookie. The network services are kept alive
by periodically calling a function supported by the kernel.
The original ATARI-ANS supports its own multitasking, background processes and
interprocess communication, these functions are NOT implemented.

UDP is supported in an ANS compatible way and used by our applications to
resolve internet addresses using the old style name server protocol.

Currently our applications are:

o a multi-window AES based telnet client (TUW-Telnet)
This program can be run as program or accessory and emulates a
VT100 terminal (without VT52 mode) for up to as many connections
as the AES provides windows and your computer has memory. :-)
The user-interface is modeled after the MW2 program (MinT Windowing
program by Allan Pratt). Like in MW2 and former UW, various fonts

including the ST system fonts, in sizes from 4x7 to 8x16 are supported.
The 7x13 standard font currently also supports the VT100 semi-graphics
characters. Also supported are cut/paste operations between TUW-Telnet
windows and 80/132 character-per-line modes.
The VT100 emulator has been proofed to be sufficient for vi on a Sun
and EDT on a VAX does like it too. It also passed the vttest program
from Per Lindberg with good results.

o a ftp server which can be run as program or accessory. It is designed
to allow "back connections" from the remote host, that is, concurrently
running telnet and ftp connections.
It supports the standard command set. Password checking is planned to be
added.

o a network monitoring program (netstat) giving information on
currently opened TCP connections.

o a setclock program to set the ATARIs clock from a timeserver.

o a ftp client will be adapted from an earlier version as soon as there
will be sufficient time to do it.

o future plans also include porting of lpr and popmail clients to the
ANS specifications.

We place the binaries on a nearby ftp-site and include the source of the
Packet driver to allow for porting to different hardware.

Archive name:

fortec.tuwien.ac.at: /tuw-tcp/tuw-tcp.zoo
login ftp password yourname@yoursite

This will be in effect after Apr 09 0:00 GMT.
Since this is a new anonymous server please be batient with us :-)

> would need more than eight bits per color channel.

``Very specialized'' includes anything having to do with color printing
and publishing. Video quality just won't hack it in that market. 24-bit
color is the standard for electronic darkrooms and artwork. We grab frames
off television when there's nothing better available, but it's obvious
where the image came from even when printed at 85-line resolution on cheap
newsprint at high speeds.

3448. software blitting

Newsgroup: comp.sys.atari.st
Date: 1992-04-08 17:55:53 UTC
From: bnell@ferrari.siemens.com
Message-ID: <bnell.702755753@ferrari>
Source record: 223888

I've been writing a game and I've written my own software blitter routines (since I have a plain 520) and I was just wondering if the routines I had were fast enough compared to any others that may be out there.

On average I can do 900 blitter operations a second. Each operation is 16x16 pixels, computes a mask, does a couple of specific things for my game and then combines the two rasters. Does anyone know if this is a decent speed or what? I've tried the built in line-a routines a long time ago but they are truly lame.

Thanks
Bill

The pixels per inch don't really matter here. The monitor is only
640x400, so you can't realistically have more than one or two full screen
windows open at once (full screen meaning 80x25 chars) without the
font being tiny and illegible. The Suns use 16 and 19 inch monitors,
so the it ends up working out OK. I think Sun has something like 1150x832
or something to that effect.

Source record: 223890

Someone looking for a terminal program with this feature built in? This is but one of many others built in to the Freeze Dried Terminal program! It seems like the author talked it over with all his friends and put in the features that everyone really wanted! Get version 2.12 as it is the most current and has the most features! Best shareware terminal package I've seen yet! I quit using Interlink in favor of this one!

It seems like I've been plugging the program here on the net... I'm not in any way affiliated with the author. I just really feel that this is the best quality shareware software available out there. And the demo version isn't crippled to the point of practical uselessness like some authors seem to feel necessary to ensure people will register!

What you have is a 16Mhz(?) SX, what is offered is a GEMULATOR running on
a DX and allows for more expansions and speed all using one monitor in
SVGA running in a window on OS/2 multitasking. Another fact is that
the GEMULATOR allows emulation of all ST rez, the AT ONCE needs an VGA
or an SVGA card along with another monitor. PC-Ditto II and I (I use
to have) only allows emulation of CGA and takes up the whole entire cpu
and screen (with emulation of less than an XT speed).

>Look at Pagestream, Calamus, DynaCAD, Avant Vector, etc.
I strongly disagree Rob, I think they have some things better than
the ST, while the ST has alot to offer as well. So the gemulator
allows both worlds to come together. Since the ST already has
a AT emulator, and people in the PC world wants an ST emulator that
does all in a window doing all rez, it would be cheaper than buying
it used with RGB and mono.

> Stalker. Without an accellerator it would be hideously slow.

I beg to differ. Based on my own experience, an unadorned 8MHz TOS 1.0 can keep up with 2400 baud in STalker. Adding a software screen accelerator and/or a CPU enhancement can increase this to the point where 9600 baud screen output is achievable. I should add however that the main limitation under VDI is not the text output speed but the scrolling speed. You'll fall a bit behind if you get a blast of LF's in a row, but under more typical situations STalker can keep up. On a T16-equipped Mega4, according to a small test program I wrote, the best I could do was around 50 scrolls/second for an average-sized window.

The one very good reason TO use a GEM window is compatibility. Sticking to a VDI-only implementation may cost you a little in terms of speed, but in my humble opinion, you gain much more than that back in terms of compatibility and ease of use.

> Also, a GEM window takes up space. Instead of 25 lines (24 with a
> status bar) you would have 23 lines and be forced to put the status
> bar at the top of the screen.

In TT medium-res, Overscan, or any of the 3rd party high-res video cards there is plenty of room for everything.

> There is also the added joy of having to handle more complex
> redraws.

True, but as they say "no pain, no gain".

> No, a window is not the way to go for me.

Evidently not. If your main concern is to get something that does the job on specific systems, then do whatever you like. I think the original question though was how to reserve a screen line in a "safe" manner, and as the ongoing discussion has shown, there are varying degrees of "safety", the ultimate being a GEM/VDI-based implementation.

> Subtract 1 from the value contained at $2AB2 and you have a shorter
> screen. Add 1 when you want to update the status bar. It was as
> simple as that. At least for monochrome. I'll have to try it with
> color as well, since I am not sure if the address applies to all ST
> machines.

Hmmmm, you're already in dangerous territory - the address you mention
is almost certainly not the same across TOS revisions, and could
conceivably change within a TOS version due to a screen accelerator.

Good luck,
Eric Rosenquist

>chips or not?

Easy... STe can use TOS 1.62, others can't. I guess you can fit them if you
use a card like the TEC, but TOS 1.62/1.6 won't work unless you have STe
hardware (unlike 2.06, which is designed to work on any ST(e)). Of course
you might write patches, but why???? TOS 1.4 is just as good in an ST.

3458. Atari European market share

Newsgroup: comp.sys.atari.st
Date: 1992-04-08 20:07:59 UTC
From: jww@uhunix.uhcc.Hawaii.Edu
Message-ID: <1992Apr8.200759.13233@news.Hawaii.Edu>
Source record: 223897

A recent DataMonitor report regarding the European computer market shows that Atari is more than holding its own against bigger counterparts. They actually beat the likes of IBM and Apple in France and Germany! It shows that the strategy of prioritizing Atari's resources in Europe was a smart maneuver resulting in their status there as an established manufacturer of mainstream machines. Although U.S. (and I guess New Zealand :-) Atari users might have chafed under the "Euro-domination" policy, it seems to me that with the Falcons winging in low and fast over the horizon, everyone will win in the long run.

The development of the STBook portable and the Falcon computers proves that Atari's (and Eric Smith's) R&D is A&W (alive and well)! In light of their proficiency at selling computers in Europe, the claim that Atari's marketing is inherently bad is disproven as well. In fact, ever since they hired people that were developers and hardcore users of Atari systems, they have become more responsive to our wishes than most other companies.

This was the breakdown in percentage of units sold by country:

England		France		Germany		Italy	
Compaq	14.0	Compaq	13.3	Commodore	15.0	Olivetti	25.0
IBM	14.0	ATARI	10.1	ATARI	13.0	IBM	21.0
Commodore	13.2	Apple	8.5	IBM	11.8	Commodore	7.9
Amstrad	7.8	Amstrad	7.9	Compaq	5.0	Amstrad	5.7
Apple	6.8	IBM	6.6	Amstrad	3.3	Apple	3.5
Olivetti	5.7	Olivetti	4.7	Olivetti	2.4	ATARI	2.9
ATARI	5.0	Commodore	3.8	Apple	1.9	Compaq	2.9
Others	38.0	Others	45.1	Others	47.0	Others	31.1

If the 1040/Mega STe and TTs can grab that much market share, then it is almost certain that something like the 50 Mhz Falcon '030 AVIARI (Audio-VIdeo And Realtime Interactive) engine will power Atari to the top!

3461. Galaxy CAD freeware for Atari ST

Newsgroup: comp.sys.atari.st
Date: 1992-04-08 20:38:39 UTC
From: jww@uhunix.uhcc.Hawaii.Edu
Message-ID: <1992Apr8.203839.18540@news.Hawaii.Edu>
Source record: 223900

Anyone tried this digital CAD program for the ST? If it gets ported
over to the hi-res TT (and Falcon!) computers, then thousands of
universities would buy a bundle.

Announcing the GALAXY CAD SYSTEM...

The Galaxy CAD System is an integrated environment for digital
design and for rapid prototyping of CAD tools and other software.
The system currently includes schematic capture and simulation of
both low-level and high-level digital designs, capture and simulation
of state diagrams and hardware flowcharts, synthesis of Intel EPLDs,
and mapping of logic into physical boards (e.g., Wire-Wrap). Galaxy runs
on most of 680X0 platforms, including the Apple Macintosh, HP9000/3XX/4XX,
Sun-3, Apollo Domain, and Atari ST. Versions for Intel 386+ and
RISC workstations are under development.

The Galaxy CAD System is an ideal environment for all levels of digital
design. It has been used successfully for both introductory logic
design and computer design courses at Wisconsin. Some of the
features of Galaxy that make it suitable for education are:

1. Integrated multiple-window environment: All Galaxy tools run
concurrently in a multiple window environment. Copying data
from one window to another is simple. Any number of simulation
sessions can be active simultaneously.

2. Hierarchy: The schematic editor and simulator are both fully
hierarchical. Building hierarchical designs is simple, including
creating symbols for modules. The simulator is a true hierarchical
simulator: it does not require a time-consuming macro-expansion
step.

3. Integrated editing and simulation: Designs are edited and
simulated in the same environment. Simulation input and output
can be shown directly on schematics, allowing direct manipulation
of net values. Unlike other products, Galaxy does not require
modification of the schematic to insert "switch" and "light"
components. In addition, Galaxy allows display of bus values in
hexadecimal directly on schematics to simplify debugging of
high-level designs. Simulation I/O can also use waveforms,
text files, and soon, tables.

4. Faults: Stuck-at faults can be introduced on the schematic
editor and simulated immediately without rebuilding the
simulation model. This provides an excellent way to display

the effects of faults.

5. Buses: Galaxy supports specification and simulation of bus structures, including complex extractions, fanouts, and bit reversal. Buses are specified by annotating nets with text. For simulation, buses are kept intact so that multiple-bit high-level components can be used. Galaxy includes a library of register-transfer components suitable for high-level computer design and simulation.

6. Alternate specification of designs: In addition to schematics, Galaxy users can specify design modules using a textual HDL (GHDL) and using hardware flowcharts and state diagrams. A hierarchical design can mix these representations as desired.

7. High-quality PostScript output: Galaxy schematics are of excellent quality. Gates are drawn according to standard practices, e.g., OR gates are drawn with the correct circular arcs and not ellipses.

8. Uniform user interface: Galaxy tools have the same user interface on all platforms, reducing student learning curves. In fact, the same tool OBJECT CODE runs on all platforms due to the unique structure of Galaxy.

9. Adding new simulation primitives is straightforward.

10. No cost for the software: Galaxy is available for free via anonymous FTP or for copying charges from A. B. Creative Consulting.

11. High quality user documentation: The comprehensive "Galaxy CAD User Manual" describes how to use all released Galaxy tools. It includes both tutorials and detailed reference material, and has extensive indexing and cross-referencing. This manual is only available in hard copy form ($20 plus shipping from A. B. Creative Consulting).

Galaxy is also an excellent environment for rapid prototyping of new CAD tools. By building on top of available resources, we have been able to prototype new tools in days or weeks that would ordinarily have taken months or years. For more information, send e-mail.

To obtain Galaxy CAD, connect to "eceserv0.ece.wisc.edu" (128.104.38.25) using FTP. Log in as "anonymous" with password "guest". Galaxy is in directory "pub/galaxy". The file "README" in that directory gives further instructions. Please register as a user by sending e-mail to "beetem@engr.wisc.edu".

3463. GEMULATOR vs ST w/ PC

Newsgroup: comp.sys.atari.st
Date: 1992-04-08 21:03:13 UTC
From: chuj@horton.Colorado.EDU
Message-ID: <1992Apr8.210313.16501@ucsu.Colorado.EDU>
Source record: 223802

I have read many posting about this and arguments on both sides. I
feel that Darek did a good job, I don't exactly know what his comments
were about the ST people, but his interest in the ST must still be
there to create this emulator.
I own an ST before I owned an pc, I still have both and now a LC II.
They both(posted earlier) have advantages. I don't feel that the
pc world are pieces of junk. They aren't, pc have better graphics and
have better software supports. They are faster and more powerful(but
will cost more in some cases).
A fully equiped 486-50Mhz PC with gemulator(assuming it to be $300.00)
will now cost $2500.00. And yet you don't get the MIDI, but you do
get the SB pro which has midi and CD-ROM interface. And you also get
to run an emulation of STE at 4096 colors in a WINDOW(I prefer under
OS/2). And if the MAC is compat. GCR, then another window using MAC.
Now you have 3 windows or 4 windows one running mono, another RGB, another
MAC, and another running Mathematica or AutoCAD or MEDIA stuff for the
PC at once! The TT itself would not be able to compete this way, but
then again the TT is another totally different System, but have you
ran an PC emulator on the TT(software) under an window running VGA mode
for that PC and get an result of and SX performance? The 68000 cpu is
assumed to be at a performance of an 386SX16. The gemulator, I know
upset many people in the ST world, infact it hits me too. I alone
spent over $1500.00 on my ST and if the gemulator does come out, then
I will be looking to sell the ST once again, but keeping all my ST
software.
DOS mounter on my MAC can read PC disks 1.44Mb, why can't the PC have
a mounter to do the same?
030-16Mhz running SoftPC can emulate in a window EGA and at 1.6 Mhz AT speed
, to bad.

Source record: 223803

Software emulation I'm aware of (pcditto 3.01) doesn't work on anything beyond a 68000. But then if Spectre works, and softPC in Mac mode works... You'd have something!

Are there any newer/improved software emulaters beyond pcditto 3.01? If so... can you say how they're improved? Functionally, I found PCDitto 3.01 Very Good... but if it won't work on my NEW Atari... I need something new, preferably software.

3466. Can you recommend a Good Color DA Calculator?

Newsgroup: comp.sys.atari.st
Date: 1992-04-08 22:19:08 UTC
From: plate@cdsmn.mn.org
Message-ID: <1992Apr08.221908.3815@cdsmn.mn.org>
Source record: 223805

A few of simple questions:

Do have a desk accesory calculator that you recommend. Either a basic add, subtract, mult., div, type or something with hex. I got hold of DACALC, but alas, it's mono only.

Speaking of which, is there a mono emulator that works for STe (1.6)? I had one that looks great on the STf, but on the STe, the screen has a syncing problem.

And FINALLY! Is there a color.cpx specifically for STe with all 4096 colors?

Thanks,
Doug Plate

Does anyone use Vanterm? I have version 4, and I like it. I can upload somewhere if there is interest.

Ok, seems like you've dunnit, Darek!
I see thousands of reasons why people could want GEMulator, e.g. to
have a useable Atari compatible notebook, not the ugly
crook from the company, but one with a nice display, floppy, etc.
or simply because of irrational licence cost for some DOS-packages.
I have some questions to Darek:
- have you tried transparent file access from GEMulator
through some PC-network?(some kind of NFS preferred)
- How is your schedule for the releases, esp. in Europe?
- What's about any plans for a unix X-Workstation version.
From what i know of the 68k-emulators, there we would
have ample speed to even emulate a TT easily with REAL ram.
- Might there be some way to run the thing w/o any external
hardware ? (problem for a portable machine)

- Peter -

P.S.: I think flaming and fuzzing around on this subject
is of little help. Let's all hope GEMulator becomes a big
success, so the user base grows and gets more impact. I
personnally feel, that Atari always had too little competition.
Maybe they need even more kicks in the ass.

It seems to me that if you have a color palette table big enough to store a different color value for every screen pixel, then you might as well just store the RGB values directly as there is no economy of memory in such a scheme (i.e. your color palette table is as big as your RGB screen memory would be).

Defining color rendition in terms of the number of pixels seems rather arbitrary to me. It probably serves for the moment, but suppose one had a screen device of sufficient size that the number of pixels exceeded the number of colors resolvable by the eye? (2^24 colors would about do it and that is around 16 megapixels.)

And it's a *lot* faster than an STE :-). Especially if the HD is IDE.

> ST. One surprise for me was that the Gemulator can run inside window

I've been seeing this... a 486/33 Mhz at 85% efficency? If GEMulator
can't run at 200% on a 386/33, I would't touch it. Seems to be a waste...
You would need a 50Mhz 486 just to achieve something worth while...
Who cares... Get the real thing for cheap these days... I personally
would love a GEMulator but have an ST and wouldn't bother elsewise with
85% being the best I can look forward to on my 386/40

Well the good thing about the Gemulator/Spectre whenever this combo becomes available is that not only will it emulate the ST and Mac, but it will do so unobtrusively, meaning it will coreside happily with OS/2 with full multitasking (unlike the other $1000 mac emulator which takes over the PC) and will cost WELL under $1000...probably around $500...since it does not have a 68000 chip on it...the chip is emulated in software (amazing, isn't it?). This also has the result of allowing it to run faster and faster on newer Intel CPUs...so you are not limited by the 8mhz speed of the 68000... When you get a 586 upgrade for your 486, your mac emulator will quintiple in speed also, along with the rest of your system.

I for one difinitely want the Gemulator...to run some of my better ST stuff (believe it or not, but alot of our games will work on it), but to run Mac stuff which I still find far superior to ST and (so far) PC apps...

I need some software! Does anyone know of any software that can produce compatibility data between people. I.E., pass out questionaires to people, have them give answers to the questions, then plug the answers into the computer and find out who the top ten most compatible members of the opposite sex are.

I'm looking for anything from PD, ShareWare, to Commercial. I need it fairly soon, too. Please respond via e-mail, just to make sure I don't miss any postings.

Thanks alot.

>Van Snyder = vsnyder@math.jpl.nasa.gov

Well, not to be picky, but I think that statement is a bit lacking. Whether or not the 386-25 is faster than the Mega STe depends a lot on what you are doing and what extras you have. It's ridiculous to say that a 386 is a *lot* faster than the Mega in general (which I am not convinced is the case)>

I have used both the 16 MHz (and yes I know not everything is fully 16 MHz or whatever, and it's still a 68000 but it IS fast) and a 386-25 and it seems to me the general environments are very close to the same in terms of speed, in fact my 8 MHz 520 with TOS 1.0 can perform some things the same as my roommate's 386, and some things faster (like animation, window draws).

The point being that such a statement as unqualified as that is unjustified and misleading ; sure the 386 may be able to do number-crunching faster but what about running Windows and screen updates? It depends on your applications.

Greetings.

I have been trying to figure out how to use the Uniterm fonts that
come with the program. Through some help of other people who have
given me help, I have gotten to this point:
Set one of the function keys to: %loadfont("a\\:uniterm\\font\\lat808.uft")
This doesn't work however, since the program always cannot open the file.
Any more suggestions? I am using Uniterm version 2.0e 015.
Thank you.

???$300 - $500???

This is gonna die fast and hard...

$300 get's you a 1040 ST w/mono monitor these days.. and that has a
built in MIDI interface... $400 will get you a 2 MB 1040 STE...

This GEMulator is sounding really lame... sorry to flame it, but it
sounds like ingenious shareware to me...

Maybe for development... but even then! No true MIDI ports, No True
sound ports, useless....

3492. MicroEMACS 3.11a-beta3available

Newsgroup: comp.sys.atari.st
Date: 1992-04-09 10:10:40 UTC
From: Bjarne Pohlers <ZX0013@DMSWWU1A.BITNET>
Message-ID: <92100.101040ZX0013@DMSWWU1A.BITNET>
Source record: 221899

Sorry for posting this again, but it seems that this did not get out of
Muenster...
- -
Now there is a beta-test version (patchlevel 3) of MicroEMACS 3.11a
available at ftp.uni-muenster.de (128.176.120.210). There are three
versions:
o me.prg : A dirty programmed version with linea-calls (I
would not guarantee that it will run on future versions of TOS)... But
that does not matter, because there are two other versions:
o gemme.prg: A fine gem-based version. Each MicroEMACS-screen is
displayed in a seperate GEM-window.
o tcme.ttp: A termcap-based version. It works under mw and should also
work under mgr.

Can you explain why MIDI is screwed up? The reason I'm asking is
that I'm a music education major, and I was thinking of getting a
notebook computer to do MIDI. I thought about waiting for the ST Book (I
have actually played on one, very nice.) but the attractive prices of
the Powerbooks have turned my head.

Later.....

Source record: 223839

Hi netters,

I hope you liked the MIDIFILE "playback" program
which I recently made available.
One person did have problems to use it on
the TT.

So I have a question:

Which switches do I have to set (within Lattice C 5.x.x)
to make it run on a TT?

Will it be sufficient to set the 4-byte align switch on,
or do I need more?

Thanks,

John

BTW. In case that you missed the program on the net:
It is available on atari.archive and GEnie and cs.ruu.nl.

3503. Problems with lattice C file functions

Newsgroup: comp.sys.atari.st
Date: 1992-04-09 15:13:41 UTC
From: johnj@echo.philips.nl
Message-ID: <1992Apr9.151341.26567@echo.philips.nl>
Source record: 223840

Hi netters,

I do have some problems with Lattice 5.x.x (last one!) when trying
to use the UNIX-compatible file functions for character reading.

I encountered this when reading MIDIFILE in my playback program,
which I uploaded recently.

I opened the file with fopen() - in raw/binary mode ofcourse.
Then I used the one character routine (I think it was fgetc()?)
to read byte-by-byte from the file.

I ran into the following problems:

I could read most files (even big ones) without a problem.
Just a few files went wrong for unknow reasons.

The file read routines just skipped a byte now and then.
They did it on the same spot every time again (when they did it).
I could find no specific pattern, neither could I generalise it.

It was not on sector bounds. Sometimes after a few KB, and then
sometimes after a few bytes again. However, the same file went wrong
on the same place(s) everytime.

Does anybody has a clue?

Although I rewrote the file routines for playback by using the
specific atari routines (Fopen(), Fread() and alike), I am
worried on the above, as that means that I cannot trust those
UNIX compatible functions at all.

Thanks,

John

>compatibles to sell???? Thanks! j harris/fairbanks

I don't beleive you could possibly blow away your ROM's by doing what you did.
I am a tech, so I'm not just guessing (and I'm not infalable either :).
I would say your problem came not from hooking the disk up, but possibly
when you had the cable hooked up backwards. If I remember right, you did say
in your first message that you tried both cable orientations, didn't you?
Now I have hooked up floppys up backwards on PC's with no ill effects, but
it could POSSIBLY cause trouble. Not to the ROM's though. Maybe to the
power supply, disk controller IC, and I think the sound chip (it's direct
connected to the disk in someway, isn't it?). I don't have an ST schematic,
YET (believe me, I'll get one someday!) so I'm going by descriptions I've read
in the `ST Internals' book.

OR - Perhaps you should recheck the way you re-connected the regular floppy.
Cable may be loose, etc.

Regards,
Doug Plate

sorry, Billy, I have a similar setup, but TOS 1.6 and no such problem.
I noticed the floppy LED flashing too. It's especially noticable with
the top cover removed and the LED exposed. My GUESS is: It's the operating
system checking for a media change, probably triggered by a timer interrupt.

Regards,
Doug

Yes, Atari is offering TOS 2.06 as an upgrade to Mega STE's. It's
$60, but I recommend against getting it just yet. See, another
upgrade they're offering is the high density floppy upgrade. For
$150, you get a new disk drive, the AJAX drive controller chip,
AND TOS 2.06, so it's a better deal that way.

3510. Re: mega ste price

Newsgroup: comp.sys.atari.st
Date: 1992-04-09 17:39:56 UTC
From: aq115@cleveland.Freenet.Edu
Message-ID: <1992Apr9.173956.7636@usenet.ins.cwru.edu>
Source record: 223847

A common misconception when it comes to certain machines (the ST, Mac, and Amiga come to mind) is that because a machine doesn't have a quadrillion software titles out for it, like the PC, it's not worth having.

I think I should note that it's not the NUMBER of titles available, but rather the QUALITY of the titles available. How much PC software is truly easy to use, has excellent features, frequent upgrades, is reasonably priced, and is current? Only the most recent, I'm sure. Only since Windows 3 came out have truly exceptional programs become available. And many of them cost an awful lot of money.

There are some really fantastic programs avilable for the ST. For example: Avant Vector, DynaCAD, Pagestream, Calamus, Arabesque Professional, MegaPaint Professional, Didot Professional, NeoDesk, STalker 3.0, Flash II, Mega-Check, and many, many others. There are programs out there to do almost anything you want. They're all extremely easy to use, because the ST was designed wtih a windowing environment in mind, not like the PC, which is a glorified text processor, and still suffers from memory expansion limitations, despite the new features of DOS 5.0.

The point I'm making, in case you haven't figured it out yet, is that sheer numbers don't always count. Quality counts.

3511. Re: software blitting

Newsgroup: comp.sys.atari.st
Date: 1992-04-09 17:45:06 UTC
From: bpat@cs.mcgill.ca
Message-ID: <1992Apr9.174506.11150@cs.mcgill.ca>
Source record: 223848

Aren't the Line-A routines supposed to use the blitter if it's present ???
I heard they should be able to do 1000 16x16 blits per second (Or at
least this is what Atari claimed in its adds :-). So with the blitter
on, it should go about 1200 + blits per seconds, no ?

As far as I'm concerned, the Line-A routines are *pretty* fast (Not as
fast as what we could do on our own with self-modifying code and all,
but good enough for any games. I wrote Tetris with them, and it's fast)

I think Atari should have stuck with them even in the TT. It can't be
that hard to change them to work with 8 bits/pixel, can it?

Patrick BETREMIEUX.

|> but they are truly lame.
|>
|> Thanks
|> Bill

It all depends on exactly what you're doing; assuming you're writing to all
4 planes in lo res you're hitting the screen at

900 * 16 * 4 = 57600 words/sec = ~138cycles/word

This seems slow for most operations. Shifting is a pain but even this can be
done reasonably effeciently. Some hints for faster code:

1. Use linear code (with computed jump ins if necessary)
2. Write to 2 planes at a time with long word instructions.
3. Use a separate routine for each operation - generalized blit routines
are always slow.
4. Rearrange any boolean formula to minimize the number of ops; eg
the classic "cookie cut" function
(SPRITE and MASK) or (BACKGROUND and (not MASK))
(4 ops) becomes:
((BACKGROUND eor SPRITE) and MASK) eor BACKGROUND
(only 3 ops)

There various other tricks but it depends on exactly what you're trying to do
and how much memory you can afford for precomputed stuff.

Steven

From: erik@microware.com
Message-ID: <12866@mcrware.UUCP>
Source record: 223701

In article <QdqrsV_00WBLI6ATZG@andrew.cmu.edu> mc4c+@andrew.cmu.edu (Mark Choi) writes:
>True color is not 8 bit color. It is not 65,000 simultaneous colors. It
>is, and only is 24/32 bit color, out of the same number. The rumors here
>are contradictory, they say true color with 65,000 on screen or
>something, THIS IS NOT TRUECOLOR.
>
>
>mark

My Guess:

In this case, I believe that True Color is meant to represent an RGB direct mode as opposed to CLUT (color lookup table). So for each pixel on the screen, you say what the RGB values will be (5 bits for each gun perhaps). With 16 bits for color information, it would be possible to have 5 bits for each of red, green, and blue (as with CD-I RGB555 mode, where the 16th bit is used for transparency), or one could perhaps add an extra bit to one of the colors (with green making the most sense, since it has the most affect on intensity).

How Atari plans to work out this graphics mode is up to them (I do not know), but you DEFINITELY will not be able to use 65536 colors from 16 million (lookup table of that size would be absurd).

I think you're confusing issues here; my comments were meant to apply to
video screen resolution only. Of course a DTP program should be able to
control color to the resolution to which the output device is capable.
You should also be careful not to confuse NTSC/PAL/SECAM artifacts with
simple color rendition issues. In those systems, cross-color and
cross-luminance effects as well as motion and aliasing effects cause
obvious abberations in an image as compared to still photography.
Advanced television and High-Definition television systems will considerably
reduce those artifacts but will not eliminate them. All video systems
are at a considerable disadvantage when compared to still photography;
however, HDTV may come quite close to the capabilies of 35mm motion-picture
film (projected quality, not still quality).

I think we're off on a tangent now... I only meant to comment on what (IMO)
constitutes a reasonable expectation of quality for video graphics output.

I think what was meant was the CPU vs CPU, graphics on the ST are faster than
the average VGA card or the average SVGA card. I've ran test of my 1040
against my 386SX, it won in many places as well, but lost in others.
One interesting note, APPLE has this add stating that their 68000 16Mhz machines
are equivalent in speed as a 286 running windows. And puts my LC II 030-16
at the speed of an SX20 running windows. It was in their latest ads all
over magazines.

>
>Rob
Rob why don't you keep your own facts straight! Your TT 030-32 will not blow away the 486-25, sorry but current benchmarks read totally in fair of the 486. That is one reason why the gemulator can run up to the speed of an ST in a window on a 486. Try emulating a AT machine by software on a TT (emulate 286 8Mhz speed). The 386-33 or the 386-40 are more very close in performance as the TT. As far as graphics are in concern, the standard card that is provided with the TT is faster than most that are provided with the AT system. Also look in current benchmarks performed by APPLE in their ill ads.

I was just wondering this. Mac 1.44 disks use the same type of
recording that MS-DOS 1.44 disks are. (Its MFM, not GCR) So a ST with a
high-density drive would be able to read and write Mac 1.44 disks with
no extra hardware. But if Spectre doesn't support 1.44 drives, then this
is all moot. (BTW, I got a program from somewhere that reads and write
Mac 1.44 meg disks in a HD IBM without extra hardware. Unfortunately, I
lost it and can't find where I got it from in the first place. :-( )

This is for all you ST fanatics that keep bringing up PC Ditto. PC Ditto is a software implementation of a 8088 emulator. It runs at about 10% the speed of an IBM XT, and is unusable in just about all respects other than listing directories. It would probably be alot faster on a TT or Falcon or whatever, but unfortunately it is no longer supported, and will not run on anything above Tos 1.2 or so.

Gemulator, on the other hand, is an emulator that will let you run ST stuff on a pretty average PC compatible (386 and better) at a very usable speed.

ATonce and other card based PC emulators are junk. They limit you to a 286 or 386sx processor, which people have pointed out are about as useful as their STE :)

I have the following items for sale for the Atari ST :

CALAMUS - desktop publishing program $90

CALAMUS Outline Art - allows you to draw pictures $85
for CALAMUS

CALAMUS font editor - Allows you to create and edit $45
fonts.

These items CAN be re-registered to the new owner.

Source record: 223716

Some recent posts have debated the speed of Intel platforms vs. Atari platforms. In the past couple days I have run a couple bench mark programs on both platforms, as well as 040/25 NeXT's. On none of the tests did my 1040ST 8Mhz come close in integer or floating point math. The 386 machines were amazingly slow compaired to the 486/33 machine that I use in the lab. The real interesting points came from compairing the 040/25 NeXT and the 486/33. I compiled an integer math bench mark program with Borland C++ as a DOS application and compaired it to the same source compiled on the NeXT using their development software. The DOS version and the NeXT version were very similar in speed with the NeXT winning (while running a Ether Net process in the background) by a _small_ fraction of seconds. To make it a little more fair I recompiled the benchmark program on the 486 as a window's application. In this case the NeXT was almost twice as fast and the 486 wasn't even multi-tasking!

Virtually the identical thing happened when I ran a copy of the Dhrystone code on both machines!

It is important to note that a lot of the speed difference may be due to differences in the compilers. Borland's C++ 3.0 is not know for its great code, while gcc with the -O compiler option is reported to be quite tight. I could e-mail the source for these programs to someone who has other compilers, especially Microsoft C v 7.0. Needless to say, I feel that any 030 computer is likely to be a little slower than a 486/xx when it comes to number crunching.

As mentioned by another post - Motorola is *much* more impressive when it comes to screen access! Flat memory architecture is superior!

One other item of interest. On another news group (*.*.68k ??) a gentleman from Motorola expressed a personal belief that an 040, if controlled by a descent compiler, could compete with the current RISC chips (I don't know which RISC chips he was thinking of exactly...). The problem is that as RISC chips become more popular the computer community will begin to spend more time and effort in developing optimized compilers for those chips and ignore the other chips, such as the 040.

Just my two cents worth!

Jon --------- Go atari!

3530. Gemulator Thoughts

Newsgroup: comp.sys.atari.st

From: revpk@cellar.org
Message-ID: <7FmZiB3w164w@cellar.org>
Source record: 223717

First of all, I'd like to express my admiration for Darek's work;
it's not easy writing an emulator program, and the Gemulator sounds like it
must've been one bitch of a job.

Second, I'd like to mention that since I'll be buying an IBM clone
Real Soon, I'd love to be able to continue to use my old ST software without
too much hassle. (Too bad that my 1040ST's resale value, monitor included,
is less than the cost of the gemulator.)

Third, I want to weigh in with a few additional comments. As nice as
the ST is, I can't use itfor much more than telecommunicating, a little
writing, and Dungeon Master and Chaos Strikes Back. There are no stores
nearby that supply ST software, and it's difficult for me to find out how
well a particular piece of software works from the ST magazines. There are
dozens of reasons why the ST market has stagnated in the U.S., and I don't
think Darek's out4rage at the Atari ST is completely unwarranted.

One thing I would like to auggest to Darek is the possibility of
adding, in later Gemulator versons, a way of linking our old STs up to our
new clones to use as an auxiliary computer/print spooler/ramdisk/whatever.
Even if it's just a way of feeding the video signal in, I'd be happy; it'd
give me a reason to keep the thing on my desk.

bye

I think most people are missing the point about Gemulator. Getting ST users to dump their STs, buy a 386 (or higher) PC and Gemulator is not it. Getting PC users to buy Gemulator is. If Gemulator is sucessful in the PC market, it will help the ST market. Maybe then when I tell PC users I own an ST they won't ask "is that like a Nintendo?".

Well..... I TRIED to get it..... I got all the parts & d/l'ed most of them.
[For the entire package for the ST you'd have to get:

AtariST.tar.Z
CADtwo.tar.Z
Fonts.tar
Mac.tar.Z
CADtools.tar.Z
Docs.tar.Z
GMDS.path
Print.tar
CodeOnly.tar.Z
CAD.tar.Z
Wafer.tar.Z
ProgEnv.tar.Z

Get the README, it explains what all of these are. You'll need 1.5 MB for the compressed tar files. So far I've used up 3.5MB of disk space for the setup not counting the contents of CADtools.tar.Z. You'll need a 16bit uncompress and a tar program (gnutar worked fine for me). You are SUPPOSED to need the Mac version because teh ST version is built on top of that.
]

The program that handles the GEM stuff for Galaxy CAD is horrible {meaning -BUGGY} on my 1040STf w/2.5mb ram. half the time the mouse disappears so I haven't been able to try anything out. Seems to work... I think. Hard to tell.....

If anybody can get it running, I'd like to know how.... (curiosity really, I don't know if I'll EVER have a use for it....)

I use UniTerm (2somethingE), due to the fact when logging into my VAX,
doing a $ SET TERM/INQ and then a $ SHOW TERM, it is indeed a VT220!
(execpt for the fact that I have to use the delete key). Ive never used
Flash, is it true VT1xx-2xx also? This is very important to a person
who spends 90% of his time logged into VMS...

Well, all of this arguing is fine and dandy, but I wonder if anyone
thought about the notion that perhaps more developers will come out to make
stuff for this gemulator on the pc (if it gets popular enough) which might
in turn create more ST software...

Besides, isn't imitation the best form of flattery?

>???$300 - $500???
>
>This is gonna die fast and hard...

If I didn't know better I'd actually think that some people are
slightly offended that the ST has been emulated on the 'x86 machines.
Obviously, the GEMULATOR won't replace an ST/TT etc. But it seems
to offer an option to those who have to use Clones (or want to) use ST
software. For someone who uses an ST at home and a Clone at work,
this seems invaluable. Or for the person who needs to use a piece of
ST software but wants to use it on a Clone...
Many people run Mac and PC software on their ST because it is their
machine of choice. Why shouldn't it be the other way around as well.
More compatibility amongst machines is a good thing IMHO. This allows
more risk taking by computer manufacturers and better choice for
consumers. I wouldn't buy a GEMULATOR, but that doesn't mean that
there aren't people that will.

How did that quote go? ..."Imitation is the sincerest form of
flattery"..?

> Benedikt
>--

Well, the file 1857bin8.zoo ONLY contains the files necessary for dumping an
emacs. For actually using it, you really need the file 1857elisp.zoo (could be
a letter wrong here, bear with my rusty memory) which contains the various
modes and packages. It is huge and contains many files you probably never will
need, but it is also very hard to tell what you NEVER will need, so I recommend
you to download it. I will however mail you atari.el if you really needs it.

>the Powerbooks have turned my head.

Well, you should check with your Apple dealer, but I read that there was a timing problem on the PowerBooks which had something to do with their modem capabilities. The symptom was occasional but regular loss of MIDI data. Again, I urge you to check this out with someone more knowledgable, it's just hearsay, it may have been fixed, the article may have been wrong etc., etc.

A studio equipment shop here in London has become an Apple dealer recently and they are selling the PowerBooks so maybe it's all OK now.

>on, it should go about 1200 + blits per seconds, no ?

The extended inquire functionspretends that on a Mega ST with blitter, you can do 5000 16x16 blits per second.

>
>As far as I'm concerned, the Line-A routines are *pretty* fast (Not as
>fast as what we could do on our own with self-modifying code and all,
>but good enough for any games. I wrote Tetris with them, and it's fast)

I wrote a Tetris clone inside a GEM window using only VDI functions, and taht's fast enough, too.

>
>I think Atari should have stuck with them even in the TT. It can't be
>that hard to change them to work with 8 bits/pixel, can it?
>
> Patrick BETREMIEUX.

There's no point in supporting a low level interface, if there are no significant advantages comparred to the VDI interface.

From what I remember reading in ST Format, Microprose said that there
were not enough hard drive owning ST users to warrant the extra effort
involved in including hard drive support in 'Golf', at least, so I
assume the samew for other games.

Very poor show if you ask me, a survey in ST Format showed that
quite a percentage of ST owners 'intended' getting a hard-drive at
some time, and add me to that. 'Golf' is such a great game, I'd waste
space on my hard drive with it anyday!

>> [stuff about price and speed of Mega STe's deleted]
>Please tell me what is the point off all this..??
>If you don't have software for these so call faster machines..??

What?! I'm very sorry but I just can't let this pass. I thought it's the quality of software that counts, not the quantity. So maybe there's not as much software for the ST as for MS-DOS, but I just don't like the non-standard user interface of all these different DOS programs. I mean, you can learn the basics of ANY GEM program in just a few moments. If you don't like it, just point in the File menu and select the last option, Quit by default. Now on a PC. You're in some obscure program and want to get out. F10? Nope. F7? Nope. ESC? Nope. ^C? Nope. ^Q? Nope. CTRL-ALT-DEL? Ahhhh, yes. In the meantime you've made quite a mess (as F10 meant "format all harddisks", F7 meant "ERASE *.*" (which can't do much harm after the format, but you get my point.)) Even the HELP key's not standard, let alone UNDO. I'd trade WordPerfect 8.5 for First Word + any time.

Okay, so Windows has more colors than GEM and it looks fancier. It should, as GEM is age-old. You know what? I'm buying the first PC with Windows in ROM, the day it's made standard and all programs run on it.

Didn't mean to insult you or something, but I just HAD to react on this. It's rather a hasty posting, so you'll probably find some untrue thing in the above to flame me on. Good luck.

>
>Please tell me what is the point off all this..??
>If you don't have software for these so call faster machines..??

That's right. There isn't any software. Don't give me these benchmark stories when you know they aren't true. Why, you couldn't even have compiled the benchmarks because there isn't software. And hey, I would know since I have those machines and I don't have any software what so ever. I mean, Lexicor's graphics programs are a hoax. Codehead Technologies are just spin doctors. They don't import top quality software and they never made any cool software of their own. Double Click only utilized your money too. Calamus is just a pipe dream, and Pagestream is a bunch of hot air. All the magazines that say they use these programs for layout are just fooling you. The Foxtex Recorders can't even be used since C-Lab, Dr.T, and Steinberg don't make any MIDI Software. Top radio stations don't use Hybrid Art's Digital Master for production and on-air playback because it's just a hoax too. There is no such thing as Optical Character Recognition software from Migraph because you can't even get a scanner. Multi TOS is a lie. MiNt never multi-tasked anything. You can only get GNU software like GNU C and GNU Emacs and GNU C++ on Apple machines. Sudden View didn't get a raving review from Jerry Pournelle. Atari just paid him to say that. Dave Small just pretends to make a Mac Emulator. And the two '030 boards are just more vaporware.

Didn't you hear? Atari folded 10 years ago.

3552. Wonky PD Mega Demo screens !!

Newsgroup: comp.sys.atari.st
Date: 1992-04-10 11:53:56 UTC
From: bd_g710@neptune.kingston.ac.uk
Message-ID: <1992Apr10.125356.1@neptune.kingston.ac.uk>
Source record: 223738

I have quite a collection of PD demos from various crews around Europe but have a few problems with some screens.
The problem is with screens that have "no borders". This includes demos : Punish your Machine, Rip-Dis, Transbeauce I + II, Cuddly Demos and a few others. On the Rip-Dis demo the first screen has writing about the demo except it covers the whole screen. If my ST (TOS 1.09) has been left off for a few hours and I load this demo up it comes out fine. Then about 10 secs later the screen sarts to go wonky and completely distorts. The sound is still fine and I can progress through the demo.
What I want to know is if anyone else has had these problems and did they find a solution (or does anyone know a solution). To me it would seem as if some chip gets too hot inside after a few seconds as it is fine after leaving it too cool down.

Any suggestions,

Simon

Could you E-mail if you have a definite answer. Cheers.

Well, you should check with your Apple dealer, but I read that there was
a timing problem on the PowerBooks which had something to do with their
modem capabilities.

No, it's an interrupt-dropping problem due to a last-minute ECO that went
through on the Power Manager firmware to deal with the screen brightness
control polling.

I think. :-)

A studio equipment shop here in London has become an Apple dealer recently
and they are selling the PowerBooks so maybe it's all OK now.

No. A bugfix is apparently imminent, but I can't say any more. I wouldn't
trust a London dealer further than I could throw a T8 at him.

I just am finishing up Digital Design 352 this semester, and I have to say the ST version of Galaxy CAD sucks big time.

However, the MAC version is quite acceptable and is very very stable.

It has also been updated much more frequently than the ST version.

The package is quite impressive. Although someone should show these guys how to design software with basic Apple GUI guidelines.

Galaxy CAD is NOT easy to use.

But it does get the job done. It does something screwy with teh keyboard mapping so I had to go through and find alternate key presses for the things basic functions.

But if you want to do small to medium scale circuit design this is an OK package to use.

The UNIX version is a tribute to just HOW BAD UNIX software can be if it is written incorrectly under X-Windows. Made my hair standup on end... (A pretty good feat because I use gel on my hair :)).

So I used the Mac version all this semester. If some one would like to get the copy, I would recommend getting it off the ftp server.

The Mac version requires 1500K in Finder mode, 2000K in Mac MultiFInder mode...which it runs pretty well too.

Running Galaxy CAD at 8Mhz is OK under Finder, really OK at 16Mhz under Finder....Not so great under MultiFinder though at 8MHz..so so at 16MHz.

It also makes a KA BOOM on your Hard drive so make sure you have enough room for about 4 Megs and 500+ files.

In non-graphics-intensive situations, I would say that it was more like 60%
the speed of an IBM XT.

> and is unusable in just about all respects other
> than listing directories.

Uses:

Word processing (PC Write)
Database management (PC File)
Games playing (just about any non-musical PD text-oriented game)
Graphics conversion (a bit slow, perhaps, but there aren't any PCX-
to-IMG translators written for the ST publicly
available)

> It would probably be alot faster on a TT or
> Falcon or whatever, but unfortunately it is no longer supported, and will
> not run on anything above Tos 1.2 or so.

It runs fine on my Mega ST under TOS 1.4.

> Gemulator, on the other hand, is an emulator that will let you run ST
> stuff on a pretty average PC compatible (386 and better) at a very
> usable speed.

A '386 PC is still not 'pretty average', given that the majority of
machines in use today are still XT/AT clones. The catalog houses are STILL
selling large quantities of '286 machines!

> ATonce and other card based PC emulators are junk. They limit you to
> a 286 or 386sx processor, which people have pointed out are about as
> useful as their STE :)

There's nothing wrong with a 286/386sx processor. One might as well label
all IBM-PC clones 'junk' because they don't have a '386dx or '486 processor.
Of course, if you write software which can =only= be used on a '386dx or '486,
you're going to starve to death while all of the 'junk' developers
are making money. Even Microsoft writes a version of Windows for the AT
clones.

> in turn create more ST software...

Not really. It would seem to me that most of the customer base for the gemulator is going to be those ST owners who wish to move to a high performance Intel-based machine. (And rather foolish customers at that, since it is far cheaper to hang on to an already-paid-for ST to run the occasional ST program than to pay $$ for the gemulator.) These customers will be spending their hard-earned money on PC-based software, not ST-based software.

Another =possible= customer base will be for those PC owners who wish to obtain Macintosh capabilities. These folks aren't going to want to purchase any ST software other than Spectre 128.

I plan on keeping my Mega ST even after obtaining the 'next generation computer' in a few years. It'll make a good first computer for my son (who's already fascinated by the neat graphics and sounds available from the ST.)

>I [saw] someone mentioned Arabesque. As far as drawing packages go (i.e not
>painting ones) has anybody had any experiences with it? I am particularly
>looking for something that can draw arrows on the ends of arbitrary curves.

I have 'Arabesque professional'. It has a vector graphics part and a
bitmap graphics part. The 'professional' in the name indicates that it
supports splines and has a few other improvements over the original
program. It does support arrows on line ends, although I am not entirely
sure this is also true for splines.

The program does have some disadvantages, though:
- input and editing of splines is clumsy (strange commands, double
clicking necessary, etc).
- It may crash on more obscure constructs (bitmap graphics in
vector drawings).
- Clicking on an object point may mean movement of that point, or
movement of the entire object. This is not done properly and
can get very annoying.
- Minor bug: before printing, you can position the output box on
the page, but after that it is ignored.

All in all, I am not entirely satisfied with the program. You
may want to look at alternatives like Becker CAD (I haveits predecessor,
Leonardo, and it had an enormous amount of bugs, but perhaps this one
is better), or one of the MegaPaint versions. As far as I know,
both have splines.

I suggest that if at all possible, you try the program yourself, as
opposed to let someone demonstrate it, before you buy.

3562. Memory management?

Newsgroup: comp.sys.atari.st
Date: 1992-04-10 15:34:21 UTC
From: cummins@a.cs.okstate.edu
Message-ID: <1992Apr10.153421.7461@a.cs.okstate.edu>
Source record: 223748

Being more of an end-user than a developer, I have a question about
memory management in a multitasking environment. First I'll mention
an assumption or two:

1) The grandaddy process (OS?) keeps track of any available memory
it's been told about.
2) Processes can request and return memory to this pool (OS tracked)
at any time.
3) The OS will free any memory allocated to a process if that process is
terminated or exited.

Okay... now the "questions"
The OS pool (of free memory) can/will become fragmented. Can this free memory
be defragmented if say a process requests 512K and only 2 chunks of 128k and
say a 370k chunk are the largest blocks available? How about Multi-Tos?
can it defrag free memory?

If a process "starts" another process... is it possible(sp) to have this
2nd process continue after the peocess creating it is exited? Or does one
need to access the "grandaddy" process and start the new process form there
in order to have it survive? If this IS the case, does that mean that
in Multi-Tos one would need to access the desktop to launch a new process?
Alternatively, does it mean that one could not launce a process from a cli
and have it survive past the point the cli is exited?

Really... these are new thoughts to me, so short answers (not in-depth
technical discussions with names of gemdos calls...) will probably help
me figure out if this Multi-tos makes sense to me (or for that matter, Multi
tasking in general). If a MMU chip is key to this... I'd like to know
how it helps.

3563. Release of RDE Version_2

Newsgroup: comp.sys.atari.st
Date: 1992-04-10 17:01:48 UTC
From: wabe@ukc.ac.uk
Message-ID: <724@hobby.ukc.ac.uk>
Source record: 223749

```
*************************************************************************
* (ALL-TOS-compatible Version of Mark Williams Co.'s RDY Ramdisk *
* ~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~ *
* *
* distributed to the Public Domain *
* ~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~ *
* by kind permission of Mark Williams Co.( Doug Peterson ) *
* ~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~ *
*************************************************************************

I have recently obtained permission from Mark Williams Co. to
release my "All-TOS" Version_2 of RDE.PRG to the Public Domain.

Previously, RDE (Version_1) worked only with TOS Versions >= 1.4 and
complemented Mark Williams Co.'s RDY which worked with earlier TOSes. The
current offering works for both cases. Version 2 also has lots of minor
code improvements and an enhanced GUI enabling all drive letters to be
mouse selected. Hence, those who work regularly on both an "old TOS" ST
as well as a "new TOS" machine will find this particularly useful.

To complement this I have also sent RDSH (a mini-shell tailored
specifically to facilitate the extra features that are accessible only
through the command-line invocation of RDE) to the Twitterpater Archives.
This, also, has some novel commands for i/ changing the DRIVE Volume Label
of a saved RDE/RDY file and ii/ for UPGRADING an "old" saved RDE/RDY file
to the new "All-TOS" format. There are also some minor RDE-specific
utilities (DESKTOP.PRG and a tailored boot source code "IQ_BOOT.C")
included with the RDSH submission.

I expect these two submissions will be released very soon.

So would I. The program double-bombs at bootup after trying to open a non-existent GEM handle (I think). I'm running with six megs, so memory ain't a problem. I peeked in the resource file...absolutely no clues what this program even does! I'm going to have a Mac friend get it for his IIcx, and we'll investigate this sucker.

>looking into buying a laptop and keeping the ST at my house in Maine while
>I'm in Indiana for the next 2-3 years. Thanks,

Since Gemulator was demoed last week at the Toronto show, you'll probably be reading more about it from eyewitnesses, but why I don't I just recap some of what I said at the show:

To run Gemulator you will need a machine with a 386sx, 386, 486sx, or 486 processor. 286's and earlier relics from the early 80's are not supported. Keep in mind that 386 based computers have been around since 1986, and the great majority of PCs sold today are at least 386sx's or higher. I didn't see the point of supporting machines that are hardly used any more. The issues of trying to emulate the 32-bit 68000 on a 16-bit 286 or even the 8-bit 8088 are just to complicated to be worth the trouble. It would be like emulating the 68000 on an Atari 800.

Gemulator can run on MS-DOS or any DOS compatible operating system such as Windows. YOU DO NOT REQUIRE WINDOWS, but if you want to multitask ST and PC software or multitask several pieces of ST software, you need Windows. But if all you want to do is run one ST program at a time, the good old C:> prompt is all you need.

Gemulator requires a PC with 4 meg of RAM. This is because the ST's memory is taken out of your PC's memory, so obviously you need more memory in the PC than what you're emulating in the ST. Gemulator will probably ship configured to emulate a 2 meg ST. If you want a larger ST, you'll need more PC memory.

As was demoed at Toronto, Gemulator's emulation of the 68000 chip and the ST hardware is virtually 100% compatible. Every program that anyone tried to run (and people were encouraged to bring their own disks) worked. Programs that were tested at the show included Pagestream, Calamus, Dynacadd, Tempus, GFA Basic, Sudden View, DC Desktop, Hotwire, Multidesk, Warp 9, Neodesk 2 and 3, APL, Laser C, and many more.

Gemulator uses a plug in card to hold the ST's TOS chips. This way you can plug in ANY version of TOS (from 1.0 to 2.06) into your PC. If you plan to use Gemulator on a laptop, just make sure you get one that has a card slot built in or a docking station option.

Both color and monochrome are emulated and you can switch from color to monochrome with a few keystrokes. No unplugging of monitors or rebooting of the computer! The one VGA monitor handles low rez, medium rez, and monochrome ST modes. In color, all 4096 colors are supported.

I can't give you any ordering information of pricing over the net, so please see the ads in ST Informer, Atari User, Atari Advantage, Current Notes, or Atari Interface Magazine for more information. Please do not send email asking for more information. Read the ads.

>NeXT was almost twice as fast and the 486 wasn't even multi-tasking!

Try running Mathematica and calculate Pi out to 11000 on your 486-33 and
your NeXT. The 486-33 in the lab came with in 3 secounds behind the NeXT
040-25. But the fact that the 486-33 is w/o a Weitek 4167($500.00).
Configurations for the 486-33, 40 megs of RAM, 130 HD, etc... NeXT, 16 Megs
or Ram (040-25) etc...
What was resulted from several people was a compilation of these cou
comparisons:
040-40 vs. 486-66
040-33 vs. 486-50
040-25 vs. 486-33
040-20 vs. 486-25
030-50 vs. 486-33
030-40 vs. 486-25
030-33 vs. 486SX, 386-40
030-25 vs. 386-25, 25SX, 33DX
030-16 vs. 386-16SX, 386-20SX, 386-20DX

These were the results of many performance testing using different programs,
raytracing and math compilations... NOTICE, the 486DX machines were without
the Weitek 4167 co-processor.

There are relatively cheap and common SCSI-to-ethernet adapters for the
Mac. These could run on an ST with one of the many ACSI-SCSI boards
available. This seems to be the most logical hardware scheme for your
software. If you can make it work, I want it.

What you want to do if you don't have a Mega STE and want a high density disk drive, is to contact Paul Wu of Omnimon Peripherals (I think that's the name). He makes a high density upgrade kit for all ST's. It's $200, and includes the disk drive and a board that plugs into the current disk controller socket (the WD1772). Then you have to solder I think one or two wires somewhere, and you're set. There's a software patch included to make it work with older TOS's, but if you get Codehead's TEC board, that won'tbe a problem.

Why use GDOS ??? The ST is perfectly capable of performing *great* font control (Proportional and all) without this piece of #@#@!!. GDOS is nothing more than a product made for you to give $$$$ to Atari.

The VDI has a function called vst_loadfonts. passing 0 as font number, and the address of the font header in ptsin(0) and ptsin(1) will have it use this font THE RIGHT WAY. You can pass in 1 for the 6x6 font (Nothing in ptsin then), 2 for 8x8 or 3 for 8x16. What more do you need ???

As for printer drivers, well, TOS accepts quite a bunch of types on its own (Like the Atari Laser, any Epson comp. dot matrix, even some color ones)

And using the 6x6 font is good in a window, as it will make up for the space taken by the window border !!!

Source record: 223659

While trying to clean up my sh204..

I hooked up my atari SH204 (20 meg) to the DMA out on my toadfile 85 (icd host adapter, seagate drive), I changed the 204' scsi id to 1, (the toadfile like most hd packages default to 0), everything was fine.

The toadfile 85 has 6 partitions of ~ 14 meg, I moved everything to the upper 3 partitions and copied the three partitions of the 204 to the lower 3 partitions. All good and fine..

Then, I used the hdx that came with the 204, dated March 27 1986 (BAD MOVE) and proceeded to format HD 1 (changing the value from the default 0). Well, then the wrong light is blinking. My toadfile blinks for ~ 10 seconds and then the first 3 partions have been zeroed. I say this coz tho' hdx was supposed to be formatting, it blinked too short to have taken out 40 some meg, coz it left the bottom 3 partitions untouched. Well, the c,d,e partions now have 0bytes 0 items, also the partition size has changed from all 14 megs to something like 40 some, 5 , and 10 meg.

I'm sure the data is there, and I'm fairly familiar with how floppies are set up with the FAT and all, but I'm in the dark with regards to how HD's are setup. Where do you look to see what partitions there are? I suppose that would tell me where the FATS are too. Is it possible that the place that describes the partitions was cleaned up and the actual FATs are still there? The whole thing wasn't wiped out coz all the data on the bottome 3 partitions are good.

This was on a 1040STe w/ tos 1.6.

Help. please...

Thank you

>Is there such a beast, or did someone works on it ?

I made a utility that extracts the files from a .gl file.
They include pics and the text control files. From this it should
be no problem to convert it to another format or make your own viewer.
I am currently working on a viewer but do not have much time to work on
it.

I still think that GEMulator is a waste. There is no pratical
use for it. Get an ST for $200 and be done with it... Why in god's
name would someone waste the time to find the ROMS, waste the diskspace
just to get something that's not even as fast as a $200 ST even with a
386/40?

AND no MIDI interface? You've just lost 50% of your market... and
SOUNDBLATER Midi interfaces are not too standard...

I'm confused...

ST hardware:
Mega ST 4 w/TOS 1.4, internal Supra drive (no SCSI mech) make offer
Complete SCSI setup: ICD card/under-monitor case/PS/fan/cables
with external DS Atari drive inside, just add your SCSI mech $195
Color SC1224 ST monitor $95
SM124 ST mono monitor $65
ST printer and modem cables $5 each
Spectre Cartridge for Mac emulation (no ROMs) $55
Drive Master allows two external drives $15
ST mouse (new) $20
1200 baud mini-modem (6"x4"x1") w/RS232 $45
8 256K 100ns SIMMS $5 each
TOS 1.2 ROMS $10
Thomson color monitor for ST/8bit/IBM EGA or as TV off VCR $125
Magnavox color monitor for ST/8bit/IBM EGA or as TV off VCR $150
Star NX10 printer including Ultrascript for ST $55
SF314 ST external DS drive $75

Atari 8bit hardware:
MPP 1000C 8bit plug-in 1200 baud modem $10
Atari XLM? 1200 baud modem w/BOTH 8bit SIO and RS232 ports $20
Atari 1020 color printer $20
410 cassette recorder $1
850 interface (lets you use RS232 modems and Cent. printers) $40
4 XF551 drives $75
3 800XL computers $35
1 65XE computer $35
Power supplies for XL/XE/1050/XF551/810, etc... $5 each
DeRe Atari manual (THE inside Atari manual) $10
Atari 400 $10

Atari ST software ($10 each, originals with docs and box) $10 each
Sundog, Stellar Crusade, KQ IV, Word Writer, Hero's Quest,
Colonel's Bequest, Police Quest 2, Shadowgate, Diamondback,
Trump's Casino Gambling, Day at the Races, Gauntlet II,
Sinbad and thieves, Bards Tale, Day of the Viper, Xenomorph,
Manhunter, Manhunter 2, Camelot, Gold Rush!, Codename: Iceman

Other electronic goodies:
JVC RX330V 7audio/3video/30presets Tuner/Amplifier $95
KORG Concert 3500 electronic piano w/88 weighted keys $795
Williams "Comet" pinball machine w/voice module $795
Sony Betamax (does Beta III) just overhauled $95
Sony kids CD w/antishock, spkr/phones/line out for stereo (new) $95

Sony AM/FM Discman w/extra battery and line out for stereo $95
IBM Game Adapter (jotstick) card $10

K-razy Kris' Computer sale. All prices are VERY low so I don't have to take them with me. I will however still consider MULTIPLE purchase offers if no one buys them in one week. Ill take GeNIE Gift of Time, COD, or check for payment. Send email to cwilliam@cs.umd.edu on Internet, C.WILLIAMS06 on GeNIE or call me at 301-595-7942 until 11pmEST

Come on now, the PC's are NOT junk, only MSDOS.... I also love
my (Dead) ST, but the reality is that my business uses PC's, and it
would be nice to have a ST at work, as well as in a window... If only
the source for GEMulator would be realesed so someone could port it to
XWindows.....

Also, It it nice that it has been seen in Canada, but where can
I get it here in the mid west???????

3584. MiNT 0.94 available

Newsgroup: comp.sys.atari.st
Date: 1992-04-11 04:52:47 UTC
From: 7103_2622@uwovax.uwo.ca
Message-ID: <1992Apr10.235247.1180@uwovax.uwo.ca>
Source record: 223670

MiNT 0.94 is now available for anonymous FTP from atari.archive.umich.edu.
Besides a lot of bug fixes (the infamous shift+cursor bug , 8
character file name bug, and MGR mouse bug are all history) this version
now supports advisory file locking on TOS files as well as on pipes.

Because of the bug fixes, I strongly recommend that you upgrade to this
version if you have 0.93. (And if you have 0.92, the new features make
the upgrade worthwhile too...)

From: georgew@tekig1.PEN.TEK.COM
Message-ID: <5052@tekig7.PEN.TEK.COM>
Source record: 223671

I recently got Baby Jo (a public domain disk) from BRE Software for my kids.
They're unable to get past the duck that asks if Baby Jo wants a carrot.
Is there a trick to this, or is this in fact a demo/shareware game that BRE has
lost the doc file for? The only text file on the disk is "txteng", which
contains the English version of the phrases spoken in "speech balloons".
In demo mode, the computer gets past the duck with no problems.

>who spends 90% of his time logged into VMS...

The old Flash only supports VT52, ANSI (Mostly VT100), and VIDTEX.
The new Flash, Flash II, seems to try to do everything. Here's some
of the support it offers:

* Supports the following terminal emulations: TTY, VIDTEX,
VT52, ANSI, VT100, VT101, VT102, VT200, VT300 & Prestel.

* Supports ST, IBM and DEC characters sets.

* Internally supports the following protocols: ASCII, Xmodem,
Ymodem, Ymodem-G, Zmodem, Modem7, WXModem, CIS B+, Kermit,
SEAlink, and Telesoftware (for Discovery/Prestel systems).

The Shareware Freeze Dried Terminal also supports as many or more
terminal emulations and a hoard of protocols. It will be interesting
to see how both of these do.

Source record: 223675

No, adding an AJAX to a 520/1040STE is of no use. AJAX requires a
16 MHz signal from the 68000 to switch into high density mode. I'm
not sure how they do this, especially since the Mega STE runs at
8 or 16, but high density works regardless of processor speed.

In a previous post, I mentioned that Paul Wu of Omnimon peripherals
sells a high density upgrade kit for allaq115
ST's and STE's for $200. You can use it to upgrade.

Does the upgrade include TOS 2.06 (sounds from what you say that it is not included). If not, it is a little pricey. $200 + $140 for the codehead board. Almost in the range of getting a cheap PC clone to use as a disk drive!

Does anyone have an address or phone number for Omnimon Peripherals?

Hi,

is there any Software available for the Atari ST to send and recive fax
with the new combined V32bis and FAX modems from Zyxel and Supra?
Where can I get such software?

Peter

Martin,

I don't know about that pecific virus, but at one show recently, WAACE
I think, GEnie was handing out disks with Alladin and a nice virus.
Of course, GEnie didn't find out until the show was over!

There is a collection of virus utilities called Hospital from programmers
in the UK. In it, there is a file called Watcher. This file sits in your
auto folder and checks each time you put a disk in to see if it has
an executable boot sector. If it does, Watcher flashes the screen.

This programs has saved us several times at AIM headquarters. :)

```

I ran several tests using PC-Ditto, some speed test as well, it was then 1 Mhz XT speed. Even using 60% of an XT speed is unbearable (if it was true to be 60%), because the XT's them self are awfully slow! I, unfortunately had to use one of these 4.77Mhz XT machines at the office. Paging down and up and spacing was almost an nightmare!

3597. -dbx- Debugger for Atari

Newsgroup: comp.sys.atari.st
Date: 1992-04-11 17:54:58 UTC
From: mcmahan@cs.unca.edu
Message-ID: <1992Apr11.175458.18552@cs.unca.edu>
Source record: 223682

Is there a dbx-ish debugger for C source code for the Atari on the
net anywhere?

gdbx doesn't work -- 1Meg isn't enough for it (and the buggy program).
In fact, all the GNU stuff doesn't work in 1 Meg except gawk...

sozobozo's adb clone is nice, but I don't really have much use for a machine
language debugger. I want something that will let me step through the
code a line at a time & see why it's crashing :)!

Thanks!

Scott

3598. HD cache for the MegaSTe

Newsgroup: comp.sys.atari.st
Date: 1992-04-11 18:23:11 UTC
From: chan@pyramid.unr.edu
Message-ID: <3354@equinox.unr.edu>
Source record: 223683

Hello out there...

Are there any suggestions for a HD cache for my MegaSTE either PD or commercial?

I DID use Cold Hard Cache 3.5 this week but it caused a minor predicament for melast night. As soon as I enabled it, my FAT tables started to deteriorate on two of my partititions (drive F and G)... maybe I am wrong... but I am taking nochances... After major surgury, I only lost 6 files (whew!)... (thanks, Brian T.)

Any suggestions (especially cache for the MegaSTE (read or write)) will be greatly appreciated...

Please email to:

>Because you not only get REAL applications (Windows, OS/2, DOS) but you get

Apparently, this line has caused quite a bit of confusion for a number of ST fanatics. What I mean by putting '(Windows, OS/2, DOS)' after applications is 'Windows applications, OS/2 applications, DOS applications'. E.G. Apps that run under Windows, OS/2, and Dos. Sorry about all the confusion this caused. But it brings up a good point, all you people that answered this message laughing about that fact that I called these things applications thinking it was making your point. On the other hand, it made YOU look ignorant. There are PLENTY of GREAT apps available on the PC platform...MANY more than are available on the ST...INCLUDING games.

>Ok, you go pay couple of hundred for Gumlulator, I pay couple of hundred
>for new 16 MHZ Falcon so we are BOTH happy

OK, I go buy Gemulator, you go buy Falcon. Than we BOTH be HAPPY! (Image of jungleman dancing around fire).

(sorry, I just couldn't resist).

re. all the Falcon rumors and the skepticism displayed by many (I feel it too), the most optimistic thing I have seen on this topic is posts on GEnie and elsewhere by really knowledgeable hardware folk. Some of these have quite cynical, from time time, about Atari's future. These folk saw the prototypes at the recent Canadian show and are bound by signed non-disclosure agreements. What they have said is totally nonspecific. However when a guy who has done some great hardware says he is really impressed and feels optimistic about Atari's future for the first time in a while, I thin we may actually be in for a pleasant surprise. Certainly hope so... I use Macs and IBMs at work and still prefer my ST, would love to see something we could all really be proud of and be glad to spend our money on come out of what I think of as my computer company. (In a weak moment I bought 100 shares of stock :-) in Atari.) Happy bytes, all,

Dave Flory, ALERTsys*Cop

I recently downloaded uE 3.10, for the Atari...

It's really nice, but is there an environment variable you can set
to tell it where the .CMD files are?

I didn't see one in any of the docs that came with
it -- or the uE manual itself (which does have a VMS logical
name you can define for VAXen about the .CMD files.

Scott

bpat@cs.mcgill.ca wrote:

b>The VDI has a function called vst_loadfonts. passing 0 as font number, and
b>the address of the font header in ptsin(0) and ptsin(1) will have it use
b>this font THE RIGHT WAY. You can pass in 1 for the 6x6 font (Nothing in
b>ptsin then), 2 for 8x8 or 3 for 8x16. What more do you need ???

Attention please: You may only use this method if you are sure that there's no GDOS installed, yet (vq_gdos)! Otherwise it won't work!

The increasing number of people who have GDOS installed is an argument for the usage of documented functions - those of GDOS.

From: aq115@cleveland.Freenet.Edu
Message-ID: <1992Apr12.000208.23654@usenet.ins.cwru.edu>
Source record: 223688

No, TOS 2.06 is not included with that high density upgrade. It's not required. See, instead of an Ajax chip, you get a small PCB board that plugs into the socket where the disk controller went, and it handles the mode switching for the disk drive. It's a simple software patch so you can use all versions of TOS. I'm not sure TOS 2.06 would eliminate the need for this patch, as TOS 2.06 is set for an Ajax chip, not his board. Next time I'm on GEnie, I'll ask him about that, and try to get his phone number for you. If you have access to GEnie, I believe is Email address is PAUL.WU.

3606. Overview of MultiTOS Reprint

Newsgroup: comp.sys.atari.st
Date: 1992-04-12 00:50:54 UTC
From: aq115@cleveland.Freenet.Edu
Message-ID: <1992Apr12.005054.25787@usenet.ins.cwru.edu>
Source record: 223690

The following is a reprint from the latest issue of Z*Net
Online Magazine about MultiTOS, Atari's new multitasking TOS,
which was first shown at Cebit, and just recently at the TAF
show in Ontario.

```
=========================================================================
* MULTITOS PREVIEW by David Pischke
=========================================================================
```

MultiTOS demonstrated

Toronto, Ont. -- Atari demonstrated MultiTOS, the multitasking version of the TOS Operating System, at the Atari Canadian Exposition on Saturday, April 4. MultiTOS, which allows users to run several programs simultaneously, was demonstrated at the Atari booth by Bill Rehbock. MultiTOS is slated for release in the fall and will be released "for the lowest price as possible", he said.

When asked whether or not the new MultiTOS will be compatible with non-68030 machines, Bill Rehbock replied that it will, but there will not be the safeguard of hardware memory protection. Hardware memory protection prevents programs that are running from writing in other programs' memory space. To increase compatibility with programs such as STalker and STeno, which pass large chunks of information between each other, PRGFLAGS has been modified to include a new flag which indicates to MultiTOS whether that program's memory will be totally private or whether it can be accessed by other resident applications.

The names of resident programs are listed under the desk accessories. The Desktop is always present and is listed as a fuji symbol followed by "Desktop". Applications can be brought into the foreground by either clicking on their menu entry or by activating their windows; MultiTOS was demonstrated running several applications concurrently with no apparent slowdown; switching between applications is also extremely fast. According to Bill Rehbock, MultiTOS, as well as finally breaking the six-accessory limit, will multitask as many programs as will fit in system memory.

As in Gribnif Software's NeoDesk, background windows can now be moved, resized, scrolled and closed without being topped. In addition, the windows of programs running in the background are updated. MultiTOS has been reported to be running with 90 (ninety) windows on the screen at once. As well, with the new MultiTOS, TOS and TTP programs are run in a window; when these programs are run, three new menu headings, Operations, Window, and Font appear in the menu bar.

According to Bill Rehbock, compatibility with earlier releases of TOS is extremely high. MultiTOS ran STalker, STeno, PageStream, and Tracker/ST successfully. Bill Rehbock warned, however, about "dialogueware", or programs which run in one dialogue box; they will not necessarily fail on the new MultiTOS, but may cause problems, because they tend to assume that they are the only application present, causing problems with redraws of windows. In addition, dialogue boxes lock out users from accessing other programs.

MultiTOS may or may not be released completely in ROM. The version demonstrated at the Atari Canadian Exposition was a beta version in program form, and because the multitasking kernel is large, Atari is considering releasing MultiTOS to the public as an extension to TOS on disk. According to Bill Rehbock, Atari wants a machine that will always come up with at least a single-tasking usable OS, even if both the floppy and hard drives cannot be accessed.

MultiTOS is based on Eric R. Smith's MiNT multitasking Kernal, but has been modified by Atari to allow multitasking of GEM programs. The Desktop Info dialogue now states "MiNT Multitasking Kernal licensed from Eric R. Smith", and MiNT now stands for "MiNT Is Now Tos". "I like what they've done," Eric Smith said. When asked about the licensing agreement and how profitable it was, Smith chuckled. "Atari got a very good deal."

Ok... and for $300 you can buy a 1040ST w 1MB, Latest TOS, Mono/Color monitor
of your choice and probably a bunch of software from someone used and
all this runs a lot faster then a 386/33 w/GEMulator. Oh yea, you get
MIDI IN/OUT too.

I have done a lot of searching for these and they are very hard, if not impossible to obtain in small quantity. I did find some listed in a MOLEX catalog, but the distributer I called was talking quantity 500!

So anyway MOLEX does make them.

I don't like the sound of the Omnimon 1.4 meg upgrade, they use a different
WD controler IC, I think its a WD279x , these do not use the same commands
that the WD 1772 uses..

Wait for a kit the uses the Real Ajax chip..

From what I have read, TOS 2.06 access the Ajax chip via a PAL or GAL, so I don't think it will ever work on a ST/FM Mega or STE...

Also about the Omnimon upgrade, the controler chip used does not have the same command set as the WD 1772, so could fail with some games..??

3616. "True Color" (Was: Falcon)

Newsgroup: comp.sys.atari.st
Date: 1992-04-12 09:20:01 UTC
From: Bob_BobR_Retelle@cup.portal.com
Message-ID: <57292@cup.portal.com>
Source record: 223700

Sigh... let's try it one more time...

"True Color" means that the human eye cannot tell the
difference between a computer generated image and the "real"
thing.

This phenomenon happens when you reach 24 bits per pixel,
giving approximately 16 million different colors.

The actual screen resolution is not that important, the number
of colors is.

From: Bob_BobR_Retelle@cup.portal.com
Message-ID: <57293@cup.portal.com>
Source record: 223601

James Robert O'Donnell Jr. asked if it was possible to send InterNet mail to commercial information services...

As far as I know, the ONLY commercial "pay service" that is connected into the InterNet is CompuServe.

You can send InterNet mail to a CompuServe subscriber if you know their CIS account number...

The address to use is: <CIS Account.Number>@Compuserve.com

For example, if the person you want to send mail to has a CIS account number of 712345,0123 you would address your mail to them as:

712345.0123@Compuserve.com

NOTE... while CIS accounts use a COMMA in the account numbers, INTERNET mail *must* use a PERIOD..

It works... I've done it...

There's a programm called QFAX which is perfectly working with my ZyXEL and it
probably working with Supra too, as it's supporting the Class 2 Command Set.
As QFAX is a german program I don't know if it's available with english docs
(an englisch and a dutch .RSC File are included).

The company that sells QFAX is Computer & Design, Eppendorfer Str.59,
5800 Hagen/Westf. 1, Germany (Fax +49 2331 5 42 03)

>but I reckon somebody must have done a similar thing already.

Zoo 2.1 shows (together with LHarc 2.0*) the best compression rates. LHarc
is a bit faster as zoo, but has some bugs which could leave you with defective
archives...
So I normally use zoo, (for it has the advantage of using the GNU-UNIXMODE,
too) but I have all archivers on my harddisc - even I only use them to depack
archives I get and repack them with zoo afterwards...

Peter,

Joppa Software has software called the STraight Fax for $69.95.
Joppa can be reaced at PO Box 214, Dallastown, PA 17313,
Phone (717) 428-3231/Fax (717) 428-0424.

THeir software sends and receives faxes, and works with any fax modem
that's Class II compliant, including the SupraFaxmodems and the Zoom
FX96/24 and the Twincom.

The price of $69.95 is good until May 31st.

OR Truecolor can mean that the value of the pixel represents the true color
that will appear on the screen (or Ektachrome, or dye-sublimation printer,
or Ektatherm paper or...) as opposed to the pixel value representing
a vector into a color map ala pseudocolor.

Sorry, when I saw the "sigh", I just couldn't resist! :-)

Message-ID: <1992Apr12.183948.22906@usenet.ins.cwru.edu>
Source record: 223609

I've emailed the author of Galaxy (at least the one mentioned in the press release) and he said that the source code for the Atari ST version is available if anyone is interested in obtaining it, and doing any work on it. The GEM problem may be a result of his not having adequate GEM documentation, and being unable to afford the Atari developers info (At that time there was no Tier 2 system...)

Perhaps someone would clean it up for the rest of us. (grin)

Greetings.
I have been trying to get moria for my ST this weekend. I tried
getting ti from atari.archive.umich.edu and the kukalba (whatever)
site where it originates from. First my deARCer didn;t work. So
I got myself the newest and latest version. Still no dice. I couldn't
even get the arc shell program to work. Then I got the ZOOed version
of moria and treid deZOOing it. No dice. I always get bombs wheneverr
I try running ZOO. Is it a buggy version? How many different versions
are there going around? I had two ZOO programs and each of them had a
diffenerent filesize. Weird.
Well, I'd like to get moria and hopefully a working version of ZOO
soon. I usually know what I am doing but this is a bad weekend for me or
something....

Hello ST netters!

I was wondering if there are any PD (or commercial for that matter) MOD
player out there that:
1) loads MOD files unattended according to a user's defined list
2) plays continuously
3) depends on the RAM of the setup

Too bad Noize Tracker STe doesn't have this feature... (great player though)

Any ideas and comments will be appreciated!!!!!!

>example: Avant Vector, DynaCAD, Pagestream, Calamus, Arabesque Professional,
>MegaPaint Professional, Didot Professional, NeoDesk, STalker 3.0, Flash
>II, Mega-Check, and many, many others.

I would add to this list:

APL.68000, which is, in my opinion, the fastest APL
available for any micro.
J, which is the most exciting advance in APL in the last
dozen years (it is free for Atari users).
UNITERM, the finest terminal emulator program for any
micro I have used, (and it is free).
MAPLE, mathematically, the best symbolic algebra package
available, (but sadly the latest release is not
yet available fo the ST).
GULAM, an ancient and trusted unix like shell, still my
favorite, after 7 years.

The best advice I ever got about picking a machine is to select the
software first, and then pick a machine that will run it. I followed
that when I bought my Atari ST, and have been pleased with it since.

William:

Techincally, yes, your TOS chips are interchangable. How easily depends on whether your 1040ST has a two or six chip set. If it has two chips, then just open each one up and change the chips, just be sure to get the chips back in their corresponding sockets.

If the 1040 has a six chip set, then you'll need to do a little solder work to make it work. I'm not sure what has to be done. Perhaps someone else can tell us. I'd like to know!

Source record: 223617

Well, unffortunately, I don't know of any that will load MODs
from a user-defined list (yet), but I do know of one that runs as
an accessory and it plays MODs on an STE in the BACKGROUND. And
very nicely at that. It has the best sound quality of any ACC
MOD player I've found -- comparable to CD-Player. I haev it
playing right now as I'm typing this.

It's called Paula.ACC, but the real name is Pascal's Amiga-MOD
Player. It's not on the internet (yet), but I will attempt to
post it there. I quit upload to it because my stuff never got
posted.

When Jukebox 1.3 comes out, it will offer a shuffle mode, and
should be more stable, perhaps enough to overthrow Paula. Right
now, at version 1.2, it's a little flakey, and only works well
on a machine that's 16 MHz or greater.

For the most part, the above is true. However, I have one of the first Mega 2's ever produced. When I upgraded to TOS 1.4, I had to get a 6-chip set because the very first Megas had 6 chip sets. Unless your Mega 2 is 1988 or older, I would *strongly* advise opening it up to see if you do indeed have 2 or 6 chips in there.

>in turn create more ST software...

Okay, I've ignored this up until now, but do you REALLY THINK that anyone would develop for an EMULATOR? WHY? Would you develop for the atari 8-bit emulator thing? You might very well develop for Aladin, or something, where the base machine is cheaper than the machine you're emulating. The GEMulator is just for people who want to move away from Atari ST's and into the world of MessDOS. I would say that the majority of these people will be end-users, since programming a PC is just the biggest DOG you've ever heard of (you spend the whole time worrying sbout 64K limits and other irrelevant shit). But if you want to USE a PC, and still USE some of your ST software (for a while, until you pirate all the commercial PC equivalents [you have to pirate them, because even word processors cost ~$300]), then the GEMulator is for you. I'm a programmer, so I'm not interested.

I came across an ad for Public Data Network in Atari Advantage. Since the ad claims this service is supposed to compete (or implies it is to compete) with Genie and Compuserver AND since it boasts a $2.50/hr. connect time, I thought I'd check it out. I called an 800 number and that number gave me a local number. They give you a free 30 minutes to check things out. I didn't really have the time to do it yet, but I was just wondering if anyone else out there uses/subscribes to this service?
One thing I like is that they do NOT charge a monthly fee (if you want to go that route).

Yeah, it has a few bugs, but it's so feature packed & easy to use that
I can live with them.
Nope, I'm not happy with the ANSI emulation... it's as shitty as the rest
of the programs around for the ST except UNITERM (but uniterm doesn't
have the graphics).
Good ANSI emulation in my books, includes *FULL* ANSI emulation,
including windowing support, and your end redrawing the current
line being edited. It speeds things up a hell of a lot.
(The windowing i'm talking about is the way a bbs can define a scroll
wondow on your screen instead of redrawing that part of the screen it
tells your computer to scroll it, then it sends the last line.)

>giving approximately 16 million different colors.

Sigh :-), sorry to disappoint you, but 256 shades of grey is
no where near the limit of human vision - and that's all the
shades of grey you get with 24 bits (since grey requires all
the R, G, and B values to be the same). I've seen it with
my own eyes. Anyone with a TT can switch to grey mode (giving
just 256 shades of grey), and see it for themselves. Sure,
it's not IMEDIATELY obvious, but you can see the difference.
It is VERY obvious when a circle, of say grey level 100, appears
on a screen all of grey level 99.

So let's just say that there is not point having anything "better"
than "True Colour", just higher resolution.

>386/40?

I wouldn't mind getting a ST for $200.00 dollars, but I already have one.
But the fact that you are missing is that for $200.00, you get a ST with
no monitor at all, and the fact that for $200.00, you are probably getting
a 1 meg ST. With the GEMULATOR, you can have more memory and you can run
fast as a ST with a 486. And the fact that you get the best of ST and
PC. For me I guess is no big loss since I already have a fast enough PC
to run gemulator, but for others who need a fast pc to run ST software,
I would suggest just an ST with an monitor if that is what they are going
for is to run ST only. But for people who are going for a fast pc, and want
ST stuff as well, the Gemulator solves the problem.
>
>AND no MIDI interface? You've just lost 50% of your market... and
>SOUNDBLATER Midi interfaces are not too standard...
I don't know what you mean by SB pro not being standard, but if you are
referring just to SB, you need a module, but the SB pro already has
MIDI capabilities. I don't use MIDI, so that dept. is not what I use
my st for in the first place.
I'm not trying to get people to sell ST just to get the gemulator, NO WAY!
I love the ATARI ST and the STE along with the TT. I can't wait to see the
FALCON as well!!! No, my intention for any postings is that people who
have the same situation as me, ST with a PC, I prefer to have a emulato
for the PC so that I don't need to fork out money for a HardDrive and another
monochrome monitor for the ST. Instead I can sell my ST for enough to get
a gemulator and the ROMs along with some extra cash. Then I have a STE emulator that can do
4096 colors with more available memory!!!
And the fact that I can now port my files onto a 1.44 Meg Floppy instead of
using 720K formats. That alone saved me a few bucks.

>Ok... and for $300 you can buy a 1040ST w 1MB, Latest TOS, Mono/Color monitor
> of your choice and probably a bunch of software from someone used and
> all this runs a lot faster then a 386/33 w/GEMulator. Oh yea, you get
> MIDI IN/OUT too.
>

I prefer new, sorry. Anyways used will only get one monitor, I have applic.
that will need mono, and personal software that need RGB. You can have the
latest TOS already on the gemulator and you can have more than 1 MEG RAM!
MIDI IN/OUT for somepeople is not needed, but you can get SB pro which has
it already.
IF I was to go the route of buying a new STE, 1.44 Meg floppy, Hi REZ card,
HardDrive, more memory, AT Once,monitor, all new prices, it would amount to over
$2800.00 and you get SX performance along with small 40 or 50 Meg HD.
Now go the route of a 486-33, you get Gemulator and SB pro, the result totals
about $2200.00, that gets you 130Meg HD, both high density drives, mono and
and RGB emulation of STE, and 4 megs on the 486 along with MIDI IN/OUT,
math coprocessor too. With 1024x768 256 color SVGA.
Prices are from recent adds on 486-33 with 256K cache DX, 130 Meg IDE, 4 megs
70ns, 230 Watt P/S, 3 1/2" and 5 1/4" HD floppies, SVGA....$1700.00
SB pro ... $200.00
Gemulator with ROMS ... $300.00 (spoken to Darek, he said $250 for the gemulator)
Mega STE /2 ... $899.00
SVGA (multisync) $500.00, HardDRIVE (40-50 Meg).. $300.00, 1.44 upgrade estimated(don't
exactly know, but seen) $200.00, AT once w VGA $400.00 (right?),
Hi Rez card around $600.00. These figures can be +- $100.00, not in STE prices
are more memory and Co-processor.
As anyone can see, if you are starting fresh to buy a STE and a PC, go with
the PC and the Gemulator, but if have a PC, different pc can determine what
you would like to have.

There are several fax software packages available for Atari ST/TT in Germany, some of them have all the best qualities that standalone state-of-the-art faxmachines do. There is even a direct printer-driver like fax driver for Calamus.
Dunno about the availability of these outside Germany (I have to order them directly from Germany), but there is also an US fax software, Joppa Fax, which will be shipping really soon now...

>386/40?

Face it, a $200 ST will not be able to do very much. It will have 512K/1Meg
RAM, a 720K floppy, and that is all. (No monitor means you cannot use it)

If one already has a decent PC, with 4 Megs of RAM, a hard disk, floppies,
and a monitor (a $200 ST will not have one), with GEMulator, they will have
a _useable_ "2 Meg ST".

A 2 Meg ST with mono monitor will cost more than the Gemulator. Sure, the
real machine is nice, but what you do not seem to comprehend is that
you can use your existing RAM and Monitor, whereas if you get a the ST
at around the same price as the Gemulator, you'll require even more
money to buy RAM and a Monitor for it.

Message-ID: <1992Apr13.031655.25209@oz.plymouth.edu>
Source record: 223629

My 1040STf (TOS 1.2) finally gave up the ghost..... it finally had enough of the Zubair 3D/4 meg upgrade I put in last fall and refuses to boot (with or without the upgrade board (which had only 2 meg on it.)) Oh well.......

So I'm without an ST (One that is fully functioning anyway.... I have an older 1040STf that has a bad DMA port but is fine for floppy based operations (ie. games and as a terminal)

WHat I need are the phone numbers for Atari dealers who stock CHEAP ST's [I'm on a limited budget]

Requirements: - CHEAP !!!!! (relatively speaking)
- 4 meg RAM (Need it for TeX and Minix)
- No monitor (Have two already...)
- No HD (already have a Toad/ICD 85meg external
- Mouse not necessary (I have a spare)
- Did I mention cheap ???

Several pple mentioned what seemed like REAL cheap prices in the past two weeks for STe's..... care to repeat ?

-Email preferred.... thanx

First off, because of the blatent title: I am not affiliated with Gribnif Software!

So anyway - I called Gribnif to order a Neodesk and found out that it is on special right now for $35 dollars. Now, I've never priced Neodesk, but I was told that the normal retail is $69 or something like that.

If you don't have Neodesk and your not hooked on any of the CLI's, (in other words, if you are using the built in desktop) I strongly recommend this product. Especially if you are using a hard disk.

I know this is a widely used product so, maybe eveyone here who's ever going to use Noedesk, already has it, but I thought I'd mention it anyway.

Gribnif Software: (413) 584-7887

From: morrison@ee.ualberta.ca
Message-ID: <morrison.703145823@ee.ualberta.ca>
Source record: 223633

Hey,

What is TeX? My impression is that it is a typesetter of some sort.
If this is the case, I would like to learn how to use it. I downloaded some
things from the TeX directory at terminator, but there doesn't seem to be
anything explaining configuration, files necessary for use, etc., etc. I
notice that there are two types of files referred to often, *.dvi and *.tex.
What is each of these? I assume that they are text files with embedded
formatting commands. True? If anyone can give me some hints, or better
yet, directions on how to set this up on my system, I would appreciate it.
(Then I could even print out the GCC-ST.TEX file I've been aching to have
a look at.)

Thanks in advance,

Rob Morrison

>
> --Rob

I believe (somebody correct me if I am wrong) that any ST can use the 2 chip TOS sets. I have a Mega 2 which has 6 sockets, but only has 2 ROM chips in it. I believe that there are some solder jumpers that select between the 2 and 6 chip configurations. Actully, I just got out my TOS 1.4 docs. It is easy to change the jumpers on the 1040 so that it will accept a 2 chip set. Making the Mega ST use a 6 chip set (if it currently has a 2 chip set) might require removing a small chip (I can't tell exactly from the picture). Anyway, if you know your way around a soldering iron, you should definitely be able to swap the chips without much effort. If you don't, then you'll have to hope that both machine have the same number of chips. Hope this helps.

I wonder what they meant by extra effort. TOS has file handling so what's the problem? I believe that Geoff Crammond developes his games on the ST so F1GP probably on his HD. However if Microprose access the HD directly like a lot of games access the floppy then I doubt I'd trust it anywhere near my HD.

When I built my first hard drive I made 19 way connectors by cutting off the excess from some 25 way ones. This works OK except that you only get one locking screw. I've made 23 way Amiga video plugs the same way.

For those of you who like to connect your ST to various displays, why not make a 13 way DIN to DB15 cable. DB15 connectors are cheap and in great abundance. You can then make DB15 to SCART/Composite video/Whatever very cheaply and easily.

Only if the disk is executable AND has a virus. I prefer to use Vaccine instead of Watcher these days.

Yes, this is the one by Geoff Crammond (sp!) (check the Keywords: line)

F1GP is very good graphically, with lots of buildings and trees etc. Monaco is almost brick-perfect! On the downside, it is a little like driving in a dual-controls car - the computer does a lot of the steering for you. This makes it easy to learn, but might frustrate some of the more proficient drivers. There is no option to totally switch off the computer-aided steering. The big change from REVS is the intelligence of the other drivers. The cars are obviously being driven properly and obeying the same laws of Physics that your car is, because sometimes they go just a bit too fast and lose it on a corner. Cars can also sustain damage, which causes them to go into the pits.

Don't bother asking me for driving tips - I'm hopeless at it, but in a week or two I will post my brother's settings and lap records, etc. He can do Silverstone in 1:22.5 (REVS on C64), or 1:09.9 using a slightly modified car.

>_____________________/ "You die.--more--" ## ## ## Messe!

I have to agree, if one wants good graphics, high density drives, decent
capacity HDs, easy memory upgrades etc etc, and at a price one can
afford ($200 ST get you, 720K drives, no HD, no monitor and especially
1985 graphics) then I guess one ought to
get a PC + Gemulator.

For those of us who like 680x0 boxes which we can mess about with then
the ST/TT route is the one to take (after all there isn't any other decent
and 'cheap' 680x0 box around).

Well, the evaluation model we had (not an a5000, one of its big brothers) had
some problems with its Unix. One that comes to mind was that it was possible
to lock up the machine with the mouse whilst running X windows - you needed to
powercyclye to get it going again - ouch. As for Atari Unix, its out, and has a
apparently been with developors for a while now.

TeX is a very useful powerful typesetting language... You create a .tex ASCII file that contains your text and formatting commands, run this through TeX and this creates a .dvi file (DeVice Independant) file, this .dvi file can be converted to screen display with e.g. showdvi, or to any printer with the relevant driver e.g. dvips to convert to postscript.

I use LaTeX which is a higher level set of TeX macros to create documents.

Some kind soul has written a document on how to install TeX (I forget his name). I think you need (at least) 2Mb RAM and ~3Mb disk (alot of different sized fonts).

Robin..

morrison@ee.ualberta.ca (Robert Morrison) writes:

> What is TeX? My impression is that it is a typesetter of some sort.

TeX is a typesetting language, originally developed to typeset mathematical books & articles. It's available for (almost?) every kind of machine, and it's public domain (!). In mathematical publishing it already has become the de facto standard, because with TeX you can do (almost?) everything concerning complex formulae (make a stack of 20 exponents, with 15 different sub- and superscripts :) and other math stuff.
I can't help you on the language itself - TeX is one of the things on my list of 'things to do and learn when at last I've got some time' :)
But I know there are some good books on using TeX (titles anyone?) - and I guess the purchase of such a book will be justified, not because TeX is so difficult to learn (I am told it's rather straightforward), but because it has a multitude of possibilities.
Hope this helps a little.

I have had the seme problens with my MEGA 4 because of the extra two megs.
for example, Zany Golf would crash whenever the score card appeared. I called
the dealer and he suggested that I create a 2 meg ram disk using a reset
proof ram disk like MEGMATIC (sp?). That solved my problems. Hope it helps.

Later,
Steven

Source record: 223648

Now I'd heard a rumor about a 68020 version of the Mega STE, but
I don't really see it happening. The 020 isn't much of a chip.
It has no onboard memory management unit, so MultiTOS couldn't
do hardware memory protection with it, it's overall performance
isn't much better than a 16 MHz 68000, and not many companies even
use it anymore. Apple just dropped the 68020 in the Mac LC and
replaced it with a 16 MHz 68030 in the Mac LC II.

Also, remember when the ST first came out? Remember how they got
the name "ST?" It means Sixteen/Thirty-two, as in a 16-bit
processor with a 32-bit address bus. That's why the TT is
thirty-two/thirty-two. A 32-bit processor with a 32-bit address
bus. If they don't go to a real name for the next generation of
machines (i.e. Sparrow and Falcon), then the 040 should, by all
rights, be called the SS, a 64-bit processor with a 64-bit bus.

We've already heard some genuine information on the first of the
new machines, nicknamed the Falcon 030, but we know that's not
its real name. I figure since it's in a 1040-style case, it's
probably aimed at the lower-end of the high-power market, and
will most likely replace, or at least supplement the TT. I
see the TT going away more than the Mega STE and 1040STE because
it's still Atari's bread and butter. Very few games run on the
030 machines, so they still need to keep 68000-based machines
around.

Just my two cents' worth.

Rob

I think gnu-c is still available for the ST and possibly other PD c compilers.

Best commercial compiler? All depends on who you talk to... Laser C, Mark Williams C, and others have a good following. Buy any of the current, modern compilers and you can't go wrong. You pays yer money and you takes yer choice.

3668. Public Domain Software

Hi!

I live in a rather small town with mainly IBM PC shops around.
I would like to get hold of some good Public Domain software - specifically
demo's, so that I can show off my machine to those PC owners.

The only software that I can get regularly is from the ST User and ST Format
magazines, which arrive one month late in South Africa.

I've got TCB Tracker and I am very impressed! Please could someone send some
.MOD files to me. I've heard some excellent .MOD files on the PC, but could
not convert them to TCB Tracker format

Any Public Domain software and help would be greatly appreciated!

Thanks

>Is there a public domain C compile for the ST
>and what is the best C compiler for the st?

1. There is GNU-C (gcc, g++) for the Atari around. It is very good
and on most machines available. The lastest version I have seen
for the Atari was 1.40, whereas the version 2.00 is already
released. I don't know from where you can ftp version 2.00.
1.40 is available in atari.umich.edu

2. The best C-Compiler I know is Pure-C (former Turbo-C).

Message-ID: <1992Apr13.151148.21928@newshost.lanl.gov>
Source record: 223552

The GEMULATOR really is a neat hack (saw it running at the Toronto ACE show) but one should realize it`s far from perfect... has some serious problems managing the mouse and it looks like synching timing signals might be a problem too. However, if anyone can come up with fixes for these things, Darek can (in time, anyway). Just understand that with _any_ emulator, you trade away a few things and the GEMULATOR is no different. Will be interesting to see what happens as it develops, though.

Oh, and just because you have a fast, 486-33 or similar, don't expect emulations to be blindingly fast... it just don't work that way, people.

> Any help would be greatly appreciated.

If it's just for temporary testing, just take out one chip in the bank.
Or disconnect the 3 resistors thet were installed to activate the bank.
If you used sockets for your upgrade, you could do what I did. Pry out
a chip in one bank, bend up the +5 pin, and connect wires to the socket
and the pin and put a switch somewhere on your mega. I did this to play
Knightmare and Railway Tycoon. It's not the prettiest solution, but it has worked
succesfully
for +3 months, and for some reason, make1meg doesn't work on some machines.
I've heard of people using reset proof ramdisks set to 2048, but this
has only worked for me on some programs.
Boycotting companies who write games that break on ST's is of course,
self defeating, as we can barely get them to write them for the ST at all.

Message-ID: <3762@cod.NOSC.MIL>
Source record: 223559

If there are any Keynote users on this group, you may find the
following of interest:

Forwarded from the Keynote mailing list (keynote@blink.att.com)
From: tjt (Tim Thompson)
Subject: Atari ST version of Keynote

The Atari ST version of Keynote 4.7c is in a somewhat usable state
(minor nits, but no known major problems). This includes full graphic
support. Many thanks to Mike Healy for his persistent and excellent
efforts on the port! If you have access to the source/executable area of
the Keynote archive server (e.g. if you've purchased it), you can retrieve
this alpha/beta/whatever version by requesting the file "key47cst.cpio.Z",
which is a compressed cpio containing the binary and library files.
Might need a little work to set it up (moving things into their proper
places) - email me any questions. ...Tim...tjt@blink.att.com...

3678. TOS 2.06 Upgrade in ST, Easy??

Newsgroup: comp.sys.atari.st
Date: 1992-04-13 18:34:59 UTC
From: friedric@mdd.comm.mot.com
Message-ID: <1992Apr13.183459.5924@mdd.comm.mot.com>
Source record: 223560
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Has anybody out there installed the TEC 2.06 upgrade in a circa '88 ST?

I'm considering the upgrade, and can handle a soldering iron, but would like to stay away from desoldering any chips.

How difficult is the upgrade installation?

Are the instruction easy to follow? What about the option to switch back to older TOS? Is this an additional installation.

Any comments would be greatly appreciated.

How come that the author of a program never get's to know things like this??
The Jukebox is free, and all the author ask is to get ideas and bug-reports.
(I am the author, so I know for sure that that there have been around zero
bug-reports.)

Please mail me the details: do you run the program as PRG or ACC, what program
are active when the crash happens, what TSR's are active... (One MOD? - What
MOD?) What version of the Jukebox did you use? Did you get warnings when you
extracted the program??

I suggest that you get the CS-TeX package from atari.archive or one of the other ftp servers. This package comes with a very easy to use install utility that does almost everything for you.

It also comes with a GEM-based shell that is very user-friendly and can be used without prior TeX experience.

It was $2500! Please tell me this is a misprint! If I add the price of a TT (or even just $800) I could have a NeXT, just a little more and I could have a NeXTStation Turbo with a 400Mg HD (that's about $4500 ed.). Of course at "list" price for the NeXT, the Atari Unix price looks better.

Did they say weather they had the ability to run ST/TT programs in a window while running UNIX?

Message-ID: <9204132045.AA09441@ucbvax.Berkeley.EDU>
Source record: 223571

Ummm. Well. I keep hearing that there's a port of GCC 2.0 for the ST already done, but no one will own up to knowing where it is. Anybody know of an ftp site (or a mailing address where I could mail someone so they could send me) where I can get it or so?

Also, somewhere I read that the MiNT libararies weren't yet compatible. Is this still the case?

Oh, and coming soon to atari.archive: CAWF2. Source and binaries to a nroff clone that will process MiNT man pages, and probably the man pages for the GNU utilities and so forth...

I'm also working on a port of a PD KSH clone that I found, since KSH seems to be smaller than BASH, and the last version has some problems with the newest versions of MiNT.

Mike.

3691. Verify Prob. again, & Disable 2 megs.

Newsgroup: comp.sys.atari.st
Date: 1992-04-13 21:21:48 UTC
From: JJL101@psuvm.psu.edu
Message-ID: <92104.172148JJL101@psuvm.psu.edu>
Source record: 223573
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Thanks for the replies so far folks, but alas the problem is not due to
game playing. The problem stems from not being able to do large file copies
in programs that store the files to RAM before copying to a hard drive.
As far as I can pinpoint, whenever files cross the original 2 megs of RAM
and go into the Xtra Ram boards 2 megs for storing the files between reading
of source and writing to destination, something happens.... as during the
write process I get spurious Write Error messages followed by Sense 4 errors
on the drive.
Of course I had thought it the drive or controller problem, but after
much testing with varying amounts memory being used, the logical thing is
something to do with memory.
If i load up a 2 megs of ramdisks and accs, I can copy less than 500K
of files before I start receiving these write errors, with NO ACCS or
ram disks, I can copy about 1.5 Megs of files with no problems. Anything
more and the problems begin, this is why I assume it must have something to
do with memory problems. I have not disconnected the board as I was not the
installer and hate messing with other folks work, and would much prefer a softw
are solution for disabling EXACTLY those ramchips.
Oh and this problem never show on normal file copies from the desk top
as it only loads one file into mem then copies it, but in NEODESK, VAULT,
CHEETAH, etc which load files into ram as possible and then copy, this ALWAYS
happens when the files length approach the barriers I mentioned above.
Any thoughts still appreciated,

PS. Yes I did post this problem before when I thought it stemmed from the
hard drive, but after much testing I think it is now somehow a memory problem.
How does write verify work on ICD host adaptors and software? Could it
possibly be munging this verify buffer? (as it often happens that even though
it gave an write error, I cannot seem to find anything wrong with the
written file)

I recently bought DB-19 connectors, both male and female, from a mail
order shop for electronic supplies. They've got those DB-nn connectors
for a large number of different nn.

I'd give you the address, but I doubt you want to mail order from
Germany. If these connectors are commonplace around here, I'd think
they should be available in other parts of the world as well.

Source record: 223578

I have this small problem with my new STe.
For the first three weeks the built-in floppy was whisper quiet, but for the last three weeks the drive motor has been rubbing on something, producing this annoying squeak (for lack of a better word) at a steady pace (about 3 times/sec.) Sometimes it's pretty loud, sometimes not.
The drive still does its job just fine, no problems there yet.
I originally wasn't sure if my local dealer would fix it under warranty since I mail ordered it, but when I called them to ask about it I never got that far- I was told that 'annoyances' were not covered under warranty.

Anybody have any input/ideas? I really would like to have my quiet drive back. Is there anyone from Atari out there that might have a suggestion?

Thanks-
Victor Bruhn

I haven't installed a TEC board but I've seen them. My best advice is that if you have any questions about installation, you should call CodeHead Technologies directly and they'll give you the straight scoop... 213-386-5735 or FAX 213-386-5789.

From what I've heard, it's a _very_ straightforward installation, anyway.

Tell 'em "Hutch" sent ya <grin>,

Source record: 223581

Regarding your question about the overscan mod...

I have a Mega 2 (pretty old) with a customised version of TOS 1.4 (UK) in it and I decided to have a go at the overscan mod because for my machine it consisted of nothing more than a couple of trace cuts and a couple of wires being soldered in... It took about 40 minutes (as that was the first time I'd ever cut any traces) and required only a fine tipped soldering iron and a sharp craft knife.

The result was a machine with an unobtrusive rocker switch on the back that can do 840*288 in 'medium' rez and 688*512(?) in 'hi' rez. (Low rez is improved too - 420*288 I think)

It's compatible with amost all GEM software like Neodesk, Calamus, 1st Word Plus, Gemini, GIFview etc etc. It's also thoroughly transparent, that is, when it's turned off, it's _GONE_ No compatibility problems at all.

However, there is a newer version of overscan about, that can switch from overscan to normal in software, I have to do that in hardware and reboot.

The autoswitch overscan (as it's called) is a little more complex to install but is more convenient.

All I can say, is if you have a free afternoon and the bits, it's a worthwhile hack...

Cheers, Neil Gardner

Ummm. 60? Maybe if it's running at 400 MHz. (assuming a 020 @ 20MHz is around
3ish MIPS) They should have it competeing with DEC's Alpha!

Actually I don't think they are talking about the 680x0 line, but maybe a
RISC chip. The 60 MIPS sounds like the MIPS R4000 or the Motorolla 88110.
But Atari producing a RISC computer sounds about as weird as a 020 at 400 Mhz!
How much do those chips cost apiece anyway? I just don't see Atari producing
a $5000 computer. Well that's what *I* thought when I saw the 60 MIPS.

I disagree that you can't go wrong with modern C compilers. I've tried many of the ST compilers and I am yet to find ONE that will compile ANSI standard source code. I'm learning C in school, and I use a UNIX compiler. I've tried Mark WIlliams, Lightspeed C, Madmax c (or whatever), and am currently trying to get GNU C and/or Szobon C to work. If anyone DOES know of an ANSI/UNIX c compiler please let me know what it is.

Jim

PS: is anyonedoing anything exciting with MGR and/or UNIX? I've been working on getting icons into MGR and I'm working with Sun workstations at school so.... e mail me.

>Now I'd heard a rumor about a 68020 version of the Mega STE, but
>I don't really see it happening. The 020 isn't much of a chip.
>It has no onboard memory management unit, so MultiTOS couldn't

There is nothing wrong with the 020. It just needs the 851 for
for fast/efficient memory protection.
The 020 core is still used heavily by Motorola. In fact their 68330
embedded system line uses it. It is quite a popular product.

>do hardware memory protection with it, it's overall performance
>isn't much better than a 16 MHz 68000, and not many companies even

There are enough differences to make it a much better processor to
use. Especially over a 000. And yes there are serious performance
increases.

>use it anymore. Apple just dropped the 68020 in the Mac LC and
>replaced it with a 16 MHz 68030 in the Mac LC II.

I would have to guess that 030's have come down considerably in price.
To the point where it doesn't save Apple much money to use a 020.
(And have to deal with all the different hardware products)

>
>Also, remember when the ST first came out? Remember how they got
>the name "ST?" It means Sixteen/Thirty-two, as in a 16-bit
>processor with a 32-bit address bus. That's why the TT is

>bus. If they don't go to a real name for the next generation of
>machines (i.e. Sparrow and Falcon), then the 040 should, by all
>rights, be called the SS, a 64-bit processor with a 64-bit bus.

Since when is the 040 a 64 bit processor? (Internally or Externally)

The only 64 bit processor currently shipping is from SGI. Their
R4000 box. Maybe DEC also has a R4000 shipping now too. I dunno.

Motorola has not announced it yet, but rumor has it that there will
be no 050, the next in line is the 060. (Even #'s are the big modifications
odd #'s are slight changes) That may be the first 64bit implementation
of the 000 instruction set.

As you know so much, Please list all this software...

Why is it that we don't have a good data base program,
or a good word proccesser, hard disk tools , ie, Nortons or
PC tools or a good Terminal program, no wee don't have the software
at all, and here we have nill..

On the PC here you can get support for all the main PC programs,
try that for the Atari...

I've been looking for a decent word processor for my ST. Right now I'm still using (gasp!) ST-Writer and it's okay, but I'd like to get something better. I'm a real fan of Microsoft Word for the Mac, so something similar would be nice.
Features I would want are: automatic footnoting, style sheets or equivalent, ability to import graphics and flow text, variety of font sizes and styles, and Postscript-to-disk output.
Note that I DON'T want a page-layout program, just a word processor. I read a review of 1st Word Plus some time back and it seemed to have most of these features. Can anyone comment? Plug your favorite program, here's your chance.

I am in desperate need of money and need to sell my TT.
The package includes:

TT030 Computer w/ 4MB ST RAM
50MB internal hard drive
PTC1426 color monitor
Cordless mouse
2400 Baud Supra Modem

All for the low asking price of $2100 (excluding shipping).
If you are interested, make me an offer. You can exclude
the monitor for $400.

Besides the above, you get all the other TT features like VME, LAN,
multiple serial ports, higher rez, etc.

Thanks,

Richard Hall

There once was such a utility, busy.acc. It only seemed to work on
TOS 1.0 machines, though (so I got rid of it). The logical place to
put this would be as a feature of the terminal program itself.

True. When formatting disks for the PC, be sure to use 80/9 non-twisted
format. I have heard that you can use the DRIVEPRM (or something like
that) environmental variable in MSDOS to allow reads/writes to twisted
sector disks (or disks with 82/10 formatting). I have never explored this.

I always thought DC Formatter was a bit weird in making one do two separate
things to produce a standard 720k DOS compatible disk (format with 80/9, then
write the bootsector). This is why I use a small utility dedicated to this
particular purpose (it only produces 80/9 MSDOS formatted disks). I use
either the Neodesk formatter or the one in Universal Item Selector 3 (usually
the latter, it is faster) for formatting my ST disks. I have also found that
my drive is perfectly reliable with the 82/10/twisted format (you can
figure out what your drive limits are using the DCMAXTRAK utility).

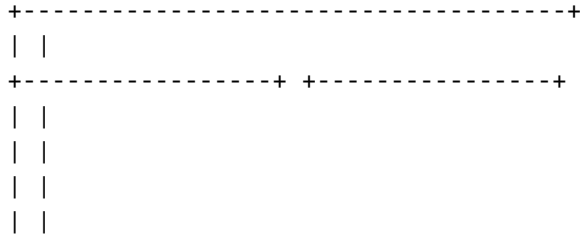
>sources?
>

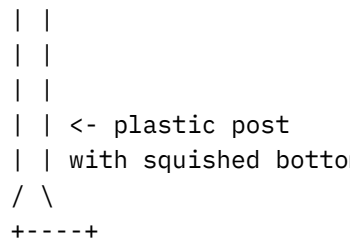
If you are in the DC area, you have several great ST stores to choose from. Two notable ones are Toad Computers at (401)544-6943 in Severna Park,MD, and L&Y Electronics in Woodbridge VA (My favorite). You should be able to call information in Woodbridge to get L&Y's phone number. Both of these stores should have several flavors of mice on the shelf (I know L&Y has some of the new beetle mice, very neat). You should definitely check out L&Y, there is a huge wall COVERED in ST games, and several glass cases full of the latest compilers, DTP, utilities, etc.

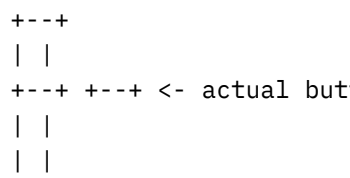
If/when you go to one of these stores GET A COPY OF CURRENT NOTES!!!!!
This is the local area for this mag, so all the local ST dealerships advertise in it. DC is the place to be if you are an Atari owner (my parents live up there, and I always bring LOTS of cash when I visit). You will also find lots of great stuff in their PD library (including MIDI stuff, check out Arpeggiator). Every ST owner to whom I have shown an issue has purchased a subscription (this is 5 folks so far).

Also, I suspect your mouse has the "peened button contact" blues. This is relatively common for those that really press hard on the buttons. This is what it looks like:

place where you put
your finger.







For this, you merely have to add a bit of height to either the button mechanism (a blob of epoxy will do it, or a couple of chunks of credit card). If this is the problem, you might want to make your next mouse one with microswitches (which seem to last longer for heavy-clickers :-).

Another possibility it that the button mechanism itself is shot. One easy way to get up and running again is to swap the right and left button mechanisms on the little board in the mouse (a bit of soldering is required). If you are using software that makes heavy use of the right button, this will not help much, but most software does not use the right one.

MC> with respect to the comments of Mr. Tramiel. He is wrong.

If Mr. Tramiel is tells us that the Falcon will have true color and he
gives his definition of true color, then IMHO it means that whatever other
definition some people use for the term "true color", it does not
necessarily apply to the Falcon. And that is what the question was about.

NOTE: this was a Golden Image mouse for a Amiga, the Yellow and Brown
wires from memory, there is a small plug inside the mouse, with the
use of a pin you can remove the pins from the connector, the pin is
use to lift up the small plastic clickers that hold these pins in..

But remove the plug first..

This will not work as there is no hardware inside the STE to support this
Ajax chip, so fitting a 1.4 meg floppy drive is still out of the question,
you will nead to get one of those hardware hacks that change the clock
rate to this chip..

no wee don't have the software
|> at all, and here we have nill..

Just mention some more applications: Cubase 3.0, Avalon 2.0, Notator 3.1, Calamus
SL, Retouche PRO, TeX, Gemini, MultiGEM, Quick Ray Tracer, Spectre GCR, Scigraph
2.0, plus every software for the Mac I like to use.
Moreover, with a little experimentation I learned to exchange files with just any
computing platform around. My Mac and IBM friends usually resorts to me when they
have problems transferring informations.

In fact my atari can do for me just about everything I need to.
I don't agree with you: in my opinion every computer is good for doing everything.
Is just the person that uses it that determine if it gives its fullest.
I don't think that you are using your computer for more than the 50% it can give.
Surely the fact that live in a country where the St has no diffusion is a good

excuse for this bashing attitude but, then again, even in Italy Atari is not considered a REAL computer.

Concluding, I think that Atari ST is not the most powerful computer in the world, but I think is still one of the most versatile and user-friendly machines around, which for me is enough.
Be realistic Roger: for everyday use how many MIPS do you need ?

Greetings from the other side of the world,
Fabrizio Lugli

Well, from what I've seen the new WordFlair II from Goldleaf looks to be a
very high-quality program loaded with features. It does most of the things
you mentioned, importing all sorts of graphics, FSM/GDOS fonts, in addition
to graphing/database/spreadsheet type functions built in to the program.
(check Atari Explorer September 1991 for a review). Goldleaf looks to be
a strong supporter of Atari, and the review in Atari Explorer was very
favorable. One point you mentioned was Postscript-to-disk ability... this
seems like a strange function for a word processor, seems like if you
want postscript you *DO* want a Desktop Publishing program (Pagestream would
do this for you). For all I know, Wordflair II might do this but I don't
know one way or the other? I don't think this is a common word
processor function, on other computers either, although like I alluded to,
Wordflair II is much more than a simple word processor.

If your price range is a bit lower, First Word Plus also has most of the
features, also look for some cool new programs coming out, such as :
Write ON (or is it Write NOW???) -- from Compo Software
That's Write -- from Compo software (Germany) -- look for it soon
in the U.S. market.
Composcript -- this is a "Postscript interpreter" maybe you could
look into this...

As you can see, there are lots of fine products available in the DTP/
Word Processing area, in contrast to what *some* people have been saying.

:-)

P.S. Myself I have Word Writer, it is a basic word processor but I only
have a 9-pin printer so DTP is a little out of my domain for a while anyway.

Greetings to the world!

I've bought me an 68881-16 copro for my MSTE for the fantastic price of
70 DM = 45 US$. At least that seems to be a fantastic price for germany.
The whole thing would be even more fantastic, if it would work, cause it
doesn't! No program recognized the copro, the tos doesn't set the cookie
and every byte-access to it's adresses is responded with two bombs. I think
I've heard rumors that a GAL in the MSTE is not working correctly (oh not
another one!), but I don't know exactly. Since my local atari-dealer has
prefered to go bancrupt, I'd like to ask the rest of the world if anyone
can help me with this problem...

Thanx in advance and bye

>from these companies for these programs, and no one seems to know what
>the deal is.
>Inviting speculation, positive or negative, BUT.... please post blatant
>pointless whining elsewhere!

Well, obviously Atari is not interested in reducing the sales of
these packages, only in increasing them.

Atari Benelux sells Dutch language versions of a number of programs,
such as Calamus and related software, First Word Plus and Timeworks
DTP and Adimens (a database program). Probably Atari Benelux has
invested in the translation of these programs to encourage sales
in the Benelux.

My speculation is that by purchasing these programs Atari USA is trying
something similar: encouraging the sales of these packages,
and indirectly the sales of Atari computers.

In the broad and final sense all institutions are educational in the
sense that they operate to form the attitudes, dispositions, abilities
and disabilities that constitute a concrete personality...Whether this
educative process is carried on in a predominantly democratic or non-
democratic way becomes, therefore, a question of transcendent importance
not only for education itself but for its final effect upon all the
interests and activites of a society that is committed to the democratic
way of life.

1) Thanks to everyone who e-mailed me about timing for Lattice C,
the vex_timv() example worked with the -v flag (stack checking
turned off). Also I was told about the 200Hz timer, and have
looked at the Dlibs code - I may use that instead.

2) Both Lattice C and Prospero C are within epsilon of ANSI compatibility,
though I don't think either have paid to be officially ANSI-checked.
I am very happy with Lattice C v5.06, and I've just had a note from
HiSoft about an imminent upgrade (v.5.5?). I'd like to see a more
C-friendly debugger and a make utility (though there are various PD
makes). People I know with Prospero C like its `workbench' integrated
environment.
[Others will be more knowledgeable than me about C on the Atari,]
[it's just that I hadn't seen anyone mention Lattice or Prospero]

3) `True colour' is surely an exaggeration anyway - I believe that the
perception of some colours (purples and purply-browns) simply CANNOT
be reproduced by RGB mixtures.

I can't remember exactly, but I believe it's closer to $2,000. Admittedly, it's hard to look at this price and remember 'power without the price', but it's not so bad when you realize that it comes with the hard drive and all the development tools. Interactive Unix for the Intel platform is about $1,700, and NeXTStep for the Intel platform is expected to be about $2,400. Since SunSoft is offering a $200 upgrade from Interactive, their cost is expected to be close to the $2K mark also.

Of course, there's a bit of salt on the wound when you realize that NONE of the Unixes (Unii?) mentioned above cost *more* than the platform they run on, except Atari's.... (yes, even the Intels, as the price of an loaded EISA box can approach $5K, while ISA boxes are not generally considered proper Intel-Unix boxes..)

>Did they say weather they had the ability to run ST/TT programs in a window
>while running UNIX?
>Ted Brown

No, but rumor is that this capability is being worked on; however to keep it from becoming a vapourware frenzy, the authors are making no preannoucements. This should definitely be applauded.

The reasoning behind having the ability to print Postscript-to-disk (in a DTP program, or word processor, or whatever) is so one can take the output somewhere else and get a high quality printout. I personally do this with Pagestream, and on my roommates MS-DOS machine w/ Windows, any program that prints using Windows can also be made to do this (i.e. word pros, spreadsheets, etc.). I then take the disk to the campus SPARC stations and print out the file on a Laserwriter, and I get high quality printouts for free!

3748. Atari ST and MIDI/game/prod software, KB 300 amp, Beyer M69 mic

Newsgroup: comp.sys.atari.st
Date: 1992-04-14 14:06:06 UTC
From: swood@vela.acs.oakland.edu
Message-ID: <14690@vela.acs.oakland.edu>
Source record: 223529
Cross-posted to: rec.music.synth,comp.sys.atari.st,misc.forsale

I plan on upgrading a lot of my equipment and software at the
end of the summer, so I am looking to get rid of a lot of the stuff now:

Atari MIDI Software
Passport Master Trax Pro (v 3.6) $125 \ all midi
MIDIMouse UltraMIDI Music Workstation $75) software
Michtron Super Conductor $10 / for $150
also:
GST C compiler $10
games:
Sierra Leisure Suit Larry I $10
Sierra Leisure Suit Larry II $10
Sierra Police Quest 2 $10
Flight Simulator II $20
Mig - 29 Fulcrum $30

Computer system forsale if the price is right:

Atari 1040 STe (Rainbow TOS 1.4 w/4 Meg installed)
4 joystick, 2 serial, 1 parallel, 1 monitor, 1 rf, 1 DMA out
Stereo sound and 320x200 512 Color or 640x400 mono graphics
Internal DS/DD 800K and External SS/DD SF354 400K drive
1 Mouse and 2 Joysticks included
NAP analog monitor and connection cable
Hayes Personal Modem 2400
software included:
Tons of PD/shareware software
LDW Power Spreadsheet (VP Planner compatible)
DBMan (DataBase III+ compatible)

If I get an offer that is sufficient to help me get my new system at this
time, I will sell it to that offer. Otherwise, I will wait till the end
of the summer. So send me those offers!!!

Other Miscillaneous equipment:

Peavey KB300 Keyboard Amplifier - 130W to a 15" and dual horn
3 inputs (HiZ) with built in reverb and three band EQ

local sales preferred (detroit metro) as it is a wee big to
ship, but if you want to pay shipping, I will send it anywhere!

asking $250

Beyer M69 stage microphone. Excellent for doing vocals or
even for miking instruments (horns/woods) Reason for selling

is that I am going to upgrade to the M88TG series of mikes.

asking $125

If you do not agree to any of the above prices, please feel free to make reasonable offers. If you are interested in trades, I am going to be in the market for Ham 2 meter HT's as well as TNC equipment that supports K.I.S.S. I am also in need of a Kawai K1r or K1m and will soon be looking for a Roland Sound Canvas.

>at "list" price for the NeXT, the Atari Unix price looks better.
^^^^^
Thanks for being one of the few who doesn't immediately start
comparing other companies "educational" prices.
Also, I understand Atari's Unix, though still a tad slow on the
mouse handling and stuff for graphic applications, is still constiderably
quicker that the NeXT OS, especially the original 030 version. A friend
of mine who does DTP tried a 040 NeXT running pagemaker in 32 bit colour
mode at a recent show. He basically said you couldn't pay him enough to use
the system as it is now. Appearntly the lag time between clicking and
anything actually happening was frustratingly long. He said the original
mac was faster(of course that was mono)
The original poster should have pointed out that this is Atari's price
for the development version of Atari's Unix, which includes compilers,
documentation, and Xfacemaker, appearantly a very nicely designed resource
builder for the Motif based interface they're using. My informant said
it was a 230 meg hd with the option to get a 4 or 500 meg instead. The unix
comes preinstalled, which anyone who has set up SCO or a similar add on
Unix would appreciate.
As a direct comparison, does anyone know the going price for SCO's
Open Desktop with all development utilities requiired to do X based
application development. This system comes on a huge number of floppys
and takes 6-8 hours to install, and based on my feed site's experience,
several weeks to tune to a reasonable reliable system. What is this
worth to people to avoid.(Assuming the preinstalled Unix from Atari
comes tuned nicely out of the box)

>
>Did they say weather they had the ability to run ST/TT programs in a window
>while running UNIX?

>
Atari has consistantly said they have no plans to do this in house. I'd imagine thay'd be willing to help any developer who thought there was enough of a market for this in implimenting it.
I don't think Atari expects a mass migration of the last Atari users left here to go to Unix. I can't imagine 99% of the people I know who use Ataris wanting to go to Unix. Most can't even figure out how to use Mint.

My children tried this a couple times last night, but it didn't seem to work.
Maybe I have a different demo version, and the duck is as far as we can get?
What happens is that Baby Jo locks up as soon as the duck appears - the
controls act dead. The duck asks about the carrot, then offers a tip: look
for hidden treasures. Then it goes back in its hole, and Baby Jo sits down
and cries: end of game.

>proof ram disk like MEGMATIC (sp?). That solved my problems. Hope it helps.

That would be my suggestion too. I once wrote a RAM disk called EDISK, a tiny, ultra-fast, reset-proof RAM disk utility.

This RAM disk reserves the requested amount of memory, and executes a reset. When the system comes back up, the memory addresses are exactly the same as they would be in an ST equipped with that much less RAM. (I checked.)

I suggest that you use this trick.

> c compiler please let me know what it is.

Neither Mark Williams, Megamax Laser C, nor Sozobon C are modern commercial compilers. They do not claim conformance to the ANSI standard. All were created before the ANSI standard was completed. They are based on the K&R description of the C programming language and although each incorporates some extensions to Classic C, none of them supports function prototypes. Sozobon 1.33i, which is free, seems to go farther in the direction of the standard than the others, but you still will need to rewrite prototypes and new-style function argument definitions in order for it to work. Lightspeed does not, to my knowledge, produce a C compiler for the Atari ST.

GNU C (GCC) does support function prototypes and does conform to the ANSI standard if you use the documented compiler switches.

Lattice C 5.0, Turbo/Pure C and Prospero C attempt to conform to the ANSI standard. I think there may be some odd cases in which they might trip over a detail, but on the whole they're reliable for processing ANSI C code.

krschimm@wsuhub.uc.twsu.edu writes:
: Is there a public domain C compile for the ST
: and what is the best C compiler for the st?

My $0.02:

GNU's gcc would be nice, if you have *tons* of memory -- it
won't work in 1Meg. In fact, none of their stuff seems to
work in 1 Meg except for gawk. (If I had that much memory,
I'd rather have a Sun or something :))

Sozobon C (is version 2.0 the up-to-the-minute latest?) is
really nice, and since it's free you can't complain!

(I also have Laser C, which is not free but is very nice too.
It allows the "asm { }" block instead of asm(" ") in sozobon.)

Source record: 223536

Roger, if your intent is to flame the Atari, there are better places to do it than in this newsgroup. People here are well aware of the Atari's weaknesses (and it's many strengths, for that matter). If you love the PC so much, then I recommend you attend the PC newsgroups and save the diskspace for the rest of us.

Personally, I think we _do_ have good word processors, data bases, hard disk tools, etc, etc, that you complained about. Perhaps not the wide assortment that the PC enjoys, but they are there nonetheless. Sorry that you do not have strong local support for the Atari in Kapiti, New Zealand, but don't feel like the lone stranger.

Sure, we would all like to see massive software support for the Atari such as that enjoyed by the PC community from outfits like Microsoft, Borland, et. al. We would all like to have a qualified Atari dealer in every town. And we would all like to see Atari expend more effort in advertising. But few of us, I venture, would be willing to exchange our current GEM based Ataris for just another clone-in-a-box. We like what we have. It may be less than the ideal, but better than the alternative.

Atari bashing is negativism in its most unproductive form... it doesn't do you, or the rest of us, any good. If you are so unhappy with your Atari, then dump it, buy a PC and leave the rest of us alone. That way, you get the machine you want and we don't have to listen to your pi**ing and moaning any more.

How do the REST of you feel about this???

3756. Re: Best Vi-Clone?

3757. Solution to munged partition data

Newsgroup: comp.sys.atari.st
Date: 1992-04-14 16:07:25 UTC
From: chang@ADELPHI-ASSB01.ARMY.MIL
Message-ID: <9204141607.AA03482@adelphi-assb01.army.mil>
Source record: 223538

WHat hdx (circa march 86) did was indeed to delete the partition info.
So using icdfrmt, I rewrote the partition info (since I knew what size
they were) and the data was restored. Unfortunately, before I chose the
option to "rewrite partition info only", I decided to rebuild partition C:,
so I lost the info on that.

Moral: if you hook up an atari sh204 to the dma out of a toadfile
(icd hostadaptor) and then try to format the sh204 with the original hdx
that came with it and end up zeroing the partion data on the first three
of your six partitions (no too mention changing the size of the partition),
you can recover the first three parition by rewriting the correct partition
info with icdfmt. This should work in other cases of munging up the
partition info. I praise ICD for including this option in their standard
disk utils.

Message-ID: <1992Apr14.162046.5991@usenet.ins.cwru.edu>
Source record: 223539

MultiTOS is still in development, that's why many of the features aren't in it yet. That's also why it's still slow. It hasn't had the polishing touches put on it yet. Since Atari's aiming for a fall release, they still have plenty of time to get it up to par.

I'm staying optomistic about it, and I'll just wait and see. Remember how long it took Apple to get Multifinder working well? It may take Atari a while too.

3759. GFA dropping support for ST? NOT!

Newsgroup: comp.sys.atari.st
Date: 1992-04-14 16:25:32 UTC
From: hutch@bellman.lanl.gov
Message-ID: <1992Apr14.162532.17478@newshost.lanl.gov>
Source record: 223540

There has been a few rumors flying around that GFA was dropping support for the Atari. I just spoke with John Barger of GFA Software Technologies in Salem, Mass, and he assures me that nothing could be further from the truth. They are, in fact, about to release GFA BASIC version 3.7 for Beta testing so that should be available RSN ("real soon now").

GFA Data Media (the UK office) has worked a deal with ST FORMAT magazine to supposedly release a version of GFA BASIC on the ST FORMAT cover disk next month or the month after. I believe this may be a slightly cut down version, perhaps with the SAVE feature disabled and of course, no compiler or documentation. It is simply a ploy to try to increase GFA sales such as they did with GFA RAYTRACE a year or so ago (which did have the effect of greatly increasing Raytrace sales).

Just thought you GFA users might like to know the _real_ story.

3760. Re: TOS 2.06 Upgrade in ST, Easy??

Newsgroup: comp.sys.atari.st
Date: 1992-04-14 16:28:09 UTC
From: aq115@cleveland.Freenet.Edu
Message-ID: <1992Apr14.162809.6457@usenet.ins.cwru.edu>
Source record: 223541

After reading all the replies to this thread, I feel compelled to
respond.

Codehead's TOS Extension Card (TEC) comes in three variants:

Standard version for $139
CPU Bridge for $155
Bus Bridge for $155

The Standard Version is the one that you solder a bunch of wires
onto your 68000. It's not an easy installation due to the
sensitivity of the 68000 chip. Too much heat will fry it.

The CPU Bridge is my personal favorite, as you desolder the
68000 and solder a socket in it's place. You plug the TEC card
into the socket, and then the 68000 into it. That way, if you
do happen to toast the 68000 when desoldering, it's as easy as
$8 to get a new one.

The Bus Bridge simply plugs into the older Mega ST internal
bus (MegaBUS), no other mods requried. It's the easiest, but
I think if you have an older Mega, you should keep that slot open
for a really neat addon like a new video card, so use the CPU
Bridge instead.

Desoldering chips is not as hard as it sounds. I've done several
68000's and numerous other chips, and that was before I ever bought
a desoldering iron. It just takes time and patience.

I assume that this clumsy hardware solution is to prevent some
jerk from the company get a lawyer and sue anybody for copyright
violation, right ? If you've got the ROM's you've bought a machine, Ha!
Now, while i understand that this is comfortable if not necessary
these days, I find it totally uncomfortable to install & use. It
not only opens doors for incompatibility but also closes doors to
PC's with other than ISA or no bus architectures. Imagine: a workstation
can run SoftPC, A PC can run GEmulator, soooo.....Ok too slow, I know!

So, Darek, don't you expect an (totally illegal, of course) hack
of Gemulator that's software only ? Or will this be an obtaineable
option, like "show me your atari licence plate and send in the
DMA/GLUE/MMU-chip to obtain your personal numbered copy of Gemulator" ?

You wrote:
>If you
>plan to use Gemulator on a laptop, just make sure you get one that has
>a card slot built in or a docking station option.

Oh, no! You don,t really mean that! Carry a docking station around ? Hmmmm.
So one of the real big advantages of Gemulator, to get a realy useable
atari-compatible notebook, remains - a dream. Please nobody suggest here
the St-book; i've seen it; it's the usual junk: no floppy, but an
unreadeable display, no mouse port, but also no monitor port (:-{puke})-.

Well, it's not _my_ personal favorite but a lot of people swear by Word Perfect for the Atari. It certainly is a powerful word processor, no doubt. It's just a shame that they don't intend to release any more updates for the Atari platform. There are a lot of reasons for this, of course, but every person who has a pirated copy of WP has surely contributed to the problem. When you steal software, we all get hurt!

Roger,

If you think Atari has no good software, their machines are too slow, etc, then go get a PC, and leave us alone. We like our machines. Atari users are a very close bunch of people. For the most part, our machines are some of the most powerful systems available to the average person. They're also the easiest to use.

We may not have a gazillion programs out there, but we do have some very good software to choose from.

Terminal Programs: STalker 3.01, Flash II

Word Processors: Signum III, Wordflair II, Word Perfect

Spreadsheets: VIP Professional

Databases: LDW Power

Utilities: NeoDesk 3.0, Hard Disk Turbo Kit, ICD Utilities, etc.

And the winner is... NOLAN BUSHNELL!

Chris Crawford is a talented programmer who cut his teeth on the Atari 8-bits (he programmed the very popular "War on the Eastern Front-1941" <or some title like that>) but he had nothing to do with founding Atari.

>Wordflair II is much more than a simple word processor.

Actually, some kind of Postscript support is pretty much standard for all decent word processors on all platforms. The usual method is to send a chunk of Postscript code to the printer to cause it to emulate a microspace printer. Then the word processor simply outputs using its ordinary routines for printing proportional fonts on a microspace printer. This is the method used by Microsoft Word, e.g., and by Word Perfect (all versions, including the Atari one).

I've been considering Wordflair II since WPCorp dropped their Atari support, but I definitely need Postscript output. Does anyone know whether Wordflair provides it?

I've installed about 4 TEC 2.06 upgrades in different ST's. Most easyest is
the Mega ST but installing it in a very old 520 ST or 1040 ST didn't cost me
more than a half hour. Every (electrician) monkey could do it.

This is getting tiresome...

"True Color" is an empty advertising/marketing term. In light of the
many factors that go into video/graphic imaging, a definition consisting
of whether the "human eye cannot tell the difference", without further
elaboration on the means by which to make such a judgment, is just as
empty. And 16 million colors, in any sane implementation, implies that
there is no color palette. Why not just let the term "true color" die and
simply ask "how are graphics implemented on the Falcon?"

This is definitely not true!
I don't know the international (english-speaking) market, but here (in Germany)
there are at least four or five excellent programs available:

SCRIPT
SIGNUM II
SIGNUM III
CyPress
That's Write

Each of these programs has the features you are asking for (exception:
That's Write is the only one with PS-Output), is better than 1st Word+,
has WYSIWYG, is fast and reliable, has nice outputs (on many printers),
and is still supported.

(I'm using SCRIPT)

Tschuess,
Johannes

> really nice, and since it's free you can't complain!

It isn't really the latest; 1.33i was released a little bit after
2.0. The 2.0 version is a revision from the original authors that
adds an extended object module format, allowing arbitrarily long
external identifier names. The 1.33i version is based on 1.2 but
significantly enhanced and debugged. I think 1.33i is a much better
setup, even at the expense of the limits on the length of external
identifiers. It's more reliable, faster, optimizes better, is easier
to set up, and runs from the Desktop as well as from a command
interpreter. It also has significant (to me, anyway) extensions
to the preprocessor borrowed from the ANSI standard.

3778. Atari 1040STe STILL for sale...

Newsgroup: comp.sys.atari.st
Date: 1992-04-14 20:04:16 UTC
From: adhir@cygnus.umd.edu
Message-ID: <12551@umd5.umd.edu>
Source record: 223459

```
================================================================
| FOR SALE - FOR SALE - FOR SALE - FOR SALE - FOR SALE - FOR SALE |
================================================================

- Atari 1040STe with 4mb ram (about 2 months old...)
Great home computer.
- 115 megs of HD space:
Seagate ST296N and Seagate ST138N w/ICD ADSCI+ Host Adapter
both mounted in a dual width, half height custom case (still
room for another 5 1/4" mechanism...I mounted the 138N behind
the 296 to leave room for a Syquest which I never ended up
buying)...powered by a 150watt XT power supply...
- SC1224 Color Monitor: 640x200 (Med and Low res)
- SM124 Mono Monitor: 640x400 (High res)
- Monitor Master switcher
- Spectre 128 w/Spectre v3.0 software
In case you don't know what this is, it's a Macintosh
emulator. Runs 20% faster than a Plus (actually it feels
more like a Mac II since the HD access is about 500% faster
and Macs rely heavily on disk access). 30 megs of HD are
dedicated to Spectre, with all the best Mac Apps running
flawlessly in Mac mode.
- LOTS AND LOTS of software...installed on the HD and on about
200 disks. Great apps (current versions) and great games (new
and old).

I am selling because I have to convert over to the PC platform due to
the nature of my job. I'll be sad to see it go.

Everything above for $1200 + COD charges (negotiable)

3781. __NEW__ Mega STE deal

Newsgroup: comp.sys.atari.st
Date: 1992-04-14 20:53:58 UTC
From: dlk0ms9s@umiami.ir.miami.edu
Message-ID: <1992Apr14.165359.13313@umiami.ir.miami.edu>
Source record: 223462

New Atari Package Deals!

Purchase a MEGA STE and get cash off on the monitor.

example:
one store, nameless, offers

MEGA STE 1 $849
MEGA STE 2 $899
MEGA STE 4 $989

Add a 50 meg hard drive with 19ms for $100
Add a 68881 co processor for $79

With the monitors:
SC 1435 $339 regular price
$249 with any MEGA

SM147 $189 regular price
$159 with any MEGA

SC 1224 $229 regular price
$159 with any MEGA

These prices are current. BTW, this is an ATARI deal. They are sponsoring
this package deal. $1250 for a color 4 meg MEGA STE is a really good deal.
Not to mention, the prices are dropping. Something like this is what to watch
out for.

> ...:-(

Uh-huh. Actually, the address I mentioned was only one way of shortening
the screen, and that way only applies to my own system as far as I know.
The documented way (suggested by someone who didn't know I knew nothing
about assembly) is:

```
dc.w $a000
-42(a0).w
```

Apparently this is how you check the line-a table to see how high the
screen is.

Does anyone know how this could be accomplished through Peeks and Pokes?
I am using Personal Pascal, which has no "asm" call in it so that is
pretty much what I am limited to. I also have Tackle Box ST, if that
helps at all.

From what I have learned from the NET, line-a works but is not gauranteed
to work on future computers. I agree with almost everyone that
shortening the screen is not a nice thing to do to future users of Atari
computers, but that is the best way to get the effect I want. I could
use a window (as was suggested) but that is SLOW. Programs like Stalker
3.x that do use Windows look great, but they can't keep up with my 2400
baud (Supra 2400 Plus, actually) modem. I hate waiting for the text to
catch up with the modem. Anyway, based on the comments about shortening

the screen made by people on the net, here is what I will be doing:

1. The status bar is optional. If you have a system that can use it,
great. If not, just turn it off. For those who don't use it, a keypress
will be enabled that brings up a status report.

Not sure why I numbered that...:) It seemed right at the time.
Now that news is flowing again, perhaps I'll be able to see the responses
people make. I missed most of the thread while things were going crazy.

Thanks for any help. It is appreciated.

> window.

I should have mentioned in my first post that my modem is not a standard
2400 baud modem. It is a Supra 2400 Plus. It it uses a compression
protocol when it can, so the text was coming across at around 4500-5000
baud isntead of 2400. This was with a screen accelerator installed. It
didn't fall far behind, of course, but enough so that the wait was
disturbing.

> in terms of compatibility and ease of use.

This is true, I suppose. It is more compatible and a great deal easier
to use for the novice. The down side is that it is slower and an agany
to implement...:)

> degrees of "safety", the ultimate being a GEM/VDI-based
> implementation.

Yes, the safest is through using the VDI. The Line-A calls do work for all Atari computers in production, I'm told, but they may not work on future computers. There is also the problem of working with MiNT. If I shorten the screen and a user starts an editor in the background, unpleasent things would happen. The way around this is to have the status bar as an option (which I elected to do). Then there is the problem of screen modifications like Overscan or the others. This is a fairly sticky problem, but not fatal. If the status bar works on your particular setup, use it. If not, turn it off and press Alt-S when you want to know what is going on (a dialog of information will appear if the user does that).

This is fairly frustrating...:)

>

> > machines.
>
> Hmmmm, you're already in dangerous territory - the address you mention
> is almost certainly not the same across TOS revisions, and could
> conceivably change within a TOS version due to a screen accelerator.

Yes, you are right about that. I should not have mentioned the $2AB2 address, since I knew it was only really valid for my own system or other systems like it (TOS 1.4). A more proper way to do it was mentioned to me, which is to do a "dc.w $a000" and then check "-42(a0).w". This would tell me the height of the screen. I am using Personal Pascal (with Tackle Box ST) though, so assembly language doesn't help me out a lot. I wish it did. Even so, I know next to nothing about assembly anyway.

Thanks for your comments.

Au contraire. Try WordFlair II, the descendant of WordUp, which could do
a lot of this. I dunno about the PS to disk, but from what I've heard,
it does the rest, and may do this as well.

> in turn create more ST software...

This is theoretically possible, but I don't think it's realistic. I don't
think PC owners (who've never had an ST) would buy a Gemulator at all.
They would if it could run Notator and Cubase, because the PC has little
or no MIDI software with integrated notation, but it can't. And maybe for
Calamus.

No, I think the only market for Gemulator is from ST owners or ex-ST owners
who already have ST software, in which case it's bad because it gives people
reason to dump their ST but keep some of their ST software. Sure, Atari
might scrape together a few bucks from it since you need the Atari ROMs,
but they sell those at cost anyway. But I don't think it'll do anything for
ST software. Just reduce the ST hardware base. By a very small amount, since
it's so expensive, and compatibility is bad currently. Now, if it could
run Notator, they would sell a few of them...

Source record: 223470

Hi, I'm sure this must be a FAQ, but I'm wondering about connecting a
3.5" HD External Drive to my ST(f). Here's the criteria :

1. Works completely with GEM/TOS.
2. Fairly inexpensive/quick set-up.

Please reply via net-mail, as I don't read this group very closely.

Thanks.

Message-ID: <1992Apr14.231448.1174@newshub.ariel.yorku.ca>
Source record: 223472

The only word processor I have for my ST is what came with it: 1st Word.
The funny thing is that I also got a program called 1st Word to Postscript.
So, type up your stuff using 1st word, then run it through 1stWord to PS and
you have the post script version of your file on the disk, then send it some-
where where you can send the file to the laser... Although the file only sets
the font up as courier, you can always edit the post script file so that you
can change the font.

____
/ o n y.

P.S - Are there any PD word processors that are better than 1st Word. It's
the only WP I have and use. I wouldn't mind buying a copy of Word Perfect for
the ST...

Eh? I use Elvis 1.4, and it is an excellent clone of VI - it even has
more features (such as a ":prev" to complement ":n"), and lets you map
ALT-key combinations!!!!!!!!!!!!

If you have trouble, it may be a config. thing. One thing I noticed
is that VI assumes you are in VT52 wrap mode (which was true on the old
TOSes, but was changed for some reason). A simple fix is to change to
wrap mode at start-up.

3800. Atari Unix ...

Newsgroup: comp.sys.atari.st
Date: 1992-04-15 00:53:35 UTC
From: baffoni@aludra.usc.edu
Message-ID: <kumvkfINNlpk@aludra.usc.edu>
Source record: 223482

Hi all,

The recent discussion on Atari Unix has left me a couple of questions
that I hope someone out there can answer (if they are doing the development)
or who can give a knowledgeable answer (remarks about how ASV will never come
out, Atari will fold before it is available, or other negative/non-productive
comments are NOT welcome).

The Atari Unix is supposed to be a full port of System VR4, with the
Wish (sp?) windowing interface. What I am wondering is if it will support
the currently-existing SCSI/ACSI ethernet cards (I would assume that it would
support any VME/Megabus cards as it is on the bus like most other UNIX ethernet
cards)? If it does support ethernet (or SLIP, etc.), will it support NFS so
that it can mount fileservers, other accounts, etc.?
Will it support 3rd party video cards (say one of the plethora of
1024x768 cards thave hve come out), or are we stuck with using only the Atari
Monochrome (or other brands I would suppose) monitors?

I realize that ASV doesn't have this support now, or it would already
be out :), but have any developers pledged support for these issues yet?

Thanks,

Mike Baffoni

UCS, USC

This is exactly like the owner of an inferior system. Trash the thing that
is supposed to be the best... You are comparing a TT030 to a NeXT 040? Are
you sick? "you're friend" was probably running on a machine with too little
memory and was waiting for swapfiles to come in and out. The only way to
get 32bit color on the NeXT is with the NeXTDimension color board which has
an Intel i860 coprocessor on it...and it displays 32 bit color at about the
same speed that the non-NeXTDimension NeXTs display mono. I am writing this
from NeXT right now. We have tons of em here on campus (at the University
of MD, College Park), and I use them every day. The original Mac was a 7.x
megahertz 68000...I cannot even believe that you are trying to tell me that
that thing feels faster than a 25mhz 68040. Amazing.

( ) I disagree that you can't go wrong with modern C compilers.
I've tried many of the ST compilers and I am yet to find ONE that will
compile ANSI standard source code. I'm learning C in school, and I
use a UNIX compiler. I've tried Mark WIlliams, Lightspeed C, Madmax c
(or whatever), and am currently trying to get GNU C and/or Szobon C
to work. If anyone DOES know of an ANSI/UNIX c compiler please let
me know what it is.

Pure C (the former Turbo C) does compile ANSI C quite well, as does, of
course, GNU C. GNU C will compile just about everything you throw at it,
as long as it's anywhere near C code and you get your options right.
Trouble is, GNU C takes forever to compile, and it fills up your HD
real fast.

3803. Re: "True Color" (Was: Falcon)

Newsgroup: comp.sys.atari.st
Date: 1992-04-15 01:40:05 UTC
From: kendall@spotted.rice.edu
Message-ID: <KENDALL.92Apr14194005@spotted.rice.edu>
Source record: 223484

The *real* meaning of True Color is that each pixel can be assinged whatever color you like - so if each pixel has eight bits of Red, Green, and Blue, then each pixel can have whatever value you wish for each of the colors. Normally, you'd have to choose 256 (or whatever) specific combinations of those eight bits and that's all the colors you could have on the screen (each pixel would have to be chosen to be one of the 256 colors). With True Color, you can make any pixel on the screen be any color you want (or as close as you can get depending on the number of bits per pixel)

True Color has nothing to do at all with how many colors there are avialiable. It's really more of a hardware graphics term. So Mr. Trameil (sp?) was right...

NeXTStep may be cute, but certainly not necessary to bring a machine like the Falcon into a workstation-style arena. There is currently a PD port of 4.3 BSD for Intel 386 on a number of archive sites. It wouldn't be too hard to grab the source for that and get it running on a 68030 box. I personally would rather have real BSD instead of NeXTStep on MACH anyway. Especially since there would be no licensing fees for the real BSD code.

Someone recently put a betatest version of the hermes uucp software
at atari.archive and I have gotten the files and configured them as would be
necessary to access my UUCP information/account. Only problem is that I can
not figure out which program is supposed to set up the environment. I am
done with the config.sys and active, etc. in the other various directories,
and now that I am finished, even login doesn't work so I can make a test
mail message and see how the header reads in the spool directories.

To top it all off, there is no uupoll program to run uucico. Any help out
there? Also, if at all possible, I could stand to hunt down the source
code to the uucico program as I will need to once again add another login
step to it.

I agree totally! Bashing a machine, or just simply stating "my machine is better than yours" is totally childish, yet most clone users feel that way.

I own a TI 99/4A as well as my ST, and I am happy with both machines. Whenever I mention TI, people say stupid things like "my PC is better than that trash", and I can't stand it, especially when that same clone user has never seen what the machine can really do. I have been seeing the same attitude being applied to other machines, such as the ST as well. I saw beyond Atari's reputation as being the producer of game machines, and saw some useful utilities for it. Yes, software support for the 99/4A or the ST is not as large as that of the IBM world, but we, the users, know it is there and are happy with what we have.

If you want to bash some PC's then you can always state the fact that the clones are simply upgraded outdated technology. First came the 8086, 8088, all the way up to the 486. Looking at the machines, how much change is there? Yes, there is a change in speed, and architectural changes to update the out-dated technology, but other than that, there is no new original thought being implemented. The computer business has become a fast food service where every once in a while, they put an extra ingredient to your hamburger. The clones with their big expensive graphics cards, can't even do what a simple TI takes for granted: sprites. Which brings me to another point about these machines: Use it for your own purposes. If you are going to deal with business, fine, get yourself a clone as most businesses use them. If it is for recreational uses, or educational, is a clone really the machine for you? If you were to put someone infront of a clone for the first time and told them to use it, they would look at you strangely and ask for the manual. Machines like the TI and ST are user friendly, which makes it easier to use. With the TI, you have menus where you pick the corresponding number. With the ST, it's as simple as move the mouse and click. Software support for the machine is not always the main reason to buy a machine. So as limited as our software libraries are, we are happy with our machines and that is what is important.

Friedrich>How difficult is the upgrade installation?
Friedrich>
Friedrich>Are the instruction easy to follow? What about the option to switch back
Friedrich>to older TOS? Is this an additional installation.
Friedrich>
Friedrich>Any comments would be greatly appreciated.
Yesterday I installed the TOS Expansion Board from Hard & Soft in Germany.
If you have your CPU already socketed you can put this card under the CPU.
There a three soldering points, two to the old CE-Pin of the old ROM's
(you have to draw them out of the socket) and one on the CE-pin of
one of ROM sockets. You can switch without any problems between the two
ROM-Versions. If you don't have you CPU socketed you may solder the board
on top of your CPU or use the so called speed bridge for connecting the
board via the mega bus.

I' ve seen ads of artifex the german distributor of the TEC. They also have
new versions of the TEC for soldering on top of a CPU or for the mega bus.

Hope that helps

3814. Re: C for the ST

Newsgroup: comp.sys.atari.st
Date: 1992-04-15 06:49:35 UTC
From: jmb8302@csseq.cs.tamu.edu
Message-ID: <12428@tamsun.tamu.edu>
Source record: 223495

Has anyone had problems with using the malloc() with Laser C.
I typed in some simple code to use linked lists and when I try to access
any of the nodes my ST bombs with a bus error. Here's the code:

```
struct node
{
int color;
struct node *next;
};
typedef struct node *next_ptr;

main()
{
next_ptr n;

n = (next_ptr) malloc(sizeof(node));
/* allocates a node, size of the structure, and type casts it to next_ptr*/
n->color = 1;
n->next = NULL;

/* I build some more nodes, and link em together. But I get a bus error...*/
```

Well mabey I should post this in st.tech...

3815. Re: Hybrid Arts Digital Master (Direct Disk Recording)

Source record: 223496
Cross-posted to: comp.sys.atari.st,rec.music.synth

My opinion having tried all the systems currently available for the Atari is don't buy Hybrid Arts, instead wait for the new Yamaha CBX-D5 (prewieved in Frankfurt). It's a 4-track hard disk recording system all in one box that connects into the DMA port of the computer. It contains an internal DSP for mixing, equalizing, reverb, chorus and other effects. It fully multitasks with the Atari and allows use of other sequencers (like the forthcoming Cubase Audio... really powerful).

Definitely it's worth waiting some months.

Source record: 223498

Ummm, with a resolution of, say, 600x800 at 24 bits you'd need
600x800x3=1440000 bytes (1406K). But then again, if the Falcon would
really be shipped with 4 or 8 Meg, what the hell.
But wouldn't BitBlts on 24 bitplanes consume too much CPU time? (Or
maybe they'd put in some Turbo-Blitter...)

P.S. Just pressing some keys on my calculator here; the same amount of
display memory would allow a monochrome res of 3394x3394... (wouldn't
like to pay for the monitor capable of that, though...)

Well, you could try Calligrapher Professional, from Working Title.

I've just recently bought it (1 week ago), and so far
it has behaved quite well, produces good quality printout and has
the ability to print postscript to disk.

Features include:
outliner,
large dictionary,
thesaurus,
import graphics (both bitmapped and vector),
table generation,
mathematical formulae,
its own vector fonts for printing (very good quality output on by BJ10e)
style tags (define the ruler/font size/font properties/formatting rules
etc for later use. Changes to tags can be applied to a single
instance or to all similarly tagged instances in the document)
ability to handle multiple columns,
multiple file documents
etc.

Did you ever think about the software being the problem and not TOS? I made the experience that clean software runs on MultiTOS and that it is not too difficult to adapt programs to it. This only applies of course if these programs are more or less clean regarding the current standards.

My comments on these programs..

SCRIPT *** Mono only does not have a thesaurus or a English dictionary..
SIGNUM II *** Mono Only, as above, not word Processer. A Calligrapher..
SIGNUM III *** German only , as above..
CyPress *** So far have never heard about this one..
That's Write *** This could be the best there is..!!

There is also Tempus Word and the French Redacteur and SCRIPT II.

> Each of these programs has the features you are asking for (exception:
> That's Write is the only one with PS-Output), is better than 1st Word+,

> (I'm using SCRIPT)
>
> Tschuess,
> Johannes

I do find Word Processers that use GDOS a pain as you can't load Fonts
on the fly and they are slow and also nead fonts for the printer..

Wordflair II is a Document processer and uses FMGDOS but does that
have the same problems as GDOS..

The English version of SIGNUM could no longer be support as the firm
that did the port I believe has folded...

>professional quality programs with? Anyone?? And if so, is it worth it
>for me to purchase GFA for DOS or Windows in order to enable me to port
>anything I werite commercially for the ST to an IBM?? Any feedback
>would be greatly appreciated!!

Hmmm... This is the third message like this I've seen in the past month or so.

Wonder what's going on.... Oh, well.

I've got both GFA/ST and GFA/PC along with QuickBasic Pro. Personally, I tend
to go the route of programming on the ST with GFA and then porting to
QuickBasick. The two are 98 percent compatable, as long as you don't do stuff
like alert boxes in your GFA code.

I _may_ prefer QuickBasic on the PC because I've been programming in it longer
(That long, terrible wait for a GFA/PC that compiled really hurt GFA!), but
I've also run into a few things that 'hurt' portability. QuickBasic uses it's
memory more efficiently, for instance. I've written code in GFA/ST that won't
load into GFA/PC, but will load into QuickBasic. And yes, it will run when
it's loaded into QuickBasic. Of course, it won't run in GFA/PC because I
can't load it all in! That's sort of a major bug. <grin>

There is a LOT of source for both programs available, so I think that's a moot
point. Enough examples exist to show the user how to do almost anything in
both languages. Help is also available for both languages from enough sources
to make the matter moot.

>CyPress
>That's Write

I'd like to add Tempus Word (also a German program) which seems comparable with SIGNUM II or III. It has some drawbacks in its version 1.10:
- no postscript output
- no output to disk in general (I wrote a small program to circumvent this)
- several slight bugs
- automatic footnoting does not always work properly
(It may have more bugs, but these are the ones I found out so far.)
Advantages:
- WYSIWYG (as usual, to take with care)
- VERY fast
- seems to run on all TOS versions out there (I use it on a MegaSTE with TOS 2.05)
- supports SIGNUM fonts

Tempus Word 2.0 is said to come out RSN. (Well, it was announced for the end of February :-)

Sorry, but you can't do it on an STE. That's because you can't cut
the traces you need to cut to be able to feed the video-chip a
different 'border-signal' (DE - Display Enable). Everything to do
with the DE-signal is included in one chip (as far as I know at
least).

The latest version of GFA is 3.5. Sounds to me as if GFA made a sale on a old
version. Probably, as it did when 2.x was 'released' in a magazine, they also
hope it'll stimulate version 3.5 sales. GFA sold quite a few version 3.0s
after 2.x was released! (After all, you don't get a manual, just the prg.)

> Will it support 3rd party video cards (say one of the plethora of
>1024x768 cards thave hve come out), or are we stuck with using only the Atari
>Monochrome (or other brands I would suppose) monitors?

(I'm not sure _anyone_ knows how to spell WiSH - it's some combination
of captials that may match what I just wrote, or not...).

The TT has only a single 3U VME slot, allowing for one half-high card.
There's a workable ethernet card (Reibl) which has a supported driver,
which allows running TCP, NFS, etc - I'm doing so now. It will support
a 3rd-party video card in the future - I doubt whether I'm at liberty
to say which one. However, with only one slot, you have to make a
choice between ethernet and video adaptor. ACSI devices aren't
appropriate for UNIX because of the way the ACSI bus hogs the processor
(Atari is, I believe, fighting off having to support the ACSI laser
printer for this reason) but it you know of a good SCSI Ethernet, I'd
be intereted in hearing details. At one time there was support for
such a device, but the mfg. discontinued it. I know there was a
company doing such a device for Macs (in Utah?), but I never did get
any more info on them.

~~~~~~~~~~~~~~~~~~~~~~~~~~
Since when is PageMaker on the NeXT? I haven't seen it. Also the only
NeXT machine capable of 32 bit color is a NeXTDimension, which is a
cube with a ND board added.

>mode at a recent show. He basically said you couldn't pay him enough to use
>the system as it is now. Appearntly the lag time between clicking and
>anything actually happening was frustratingly long. He said the original
>mac was faster(of course that was mono)

You have got to be kidding. The ND is no way a slug. If he saw a
NeXT running PageMaker it had to be a beta copy and it had to be a
terrible implementation. On the other hand you might be talking about
FrameMaker. But it still isn't that slow. Your friend or someone at the
show must have had a LOT of stuff runnning, enough to cause the machine
to swap out the application and when your friend came along it had to be
swapped back in from disk.

I use a NeXT everyday. It is my primary machine at home, that along with
a 386sx machine.

I'm glad this thread has come up. I hope we can keep it going for a while.
It is obvious that we all have something to learn. Making the right
choice is getting harder. There probably is no right choice now.

My two bits.

I am as confuse as others. I use Wordflair II as much as I can. But I revert
to Wordwriter and even STWriter, and Pagestream more than I would like. What's
great about Wordflair II:
Spell Checker
Integrated graphics and data/math.
The floating data/math regions --You can make letter into Spreadsheet.
FMSGDOS screen text and rewrites

What's terrible:
Speed of printing to HPLaser (at least on my NEC2-90)
Can't duplicate any of the neat graph/data setups --no templates
One document at a time and no merging
No tagging --Text regions powerful but painstaking

What's not so good:
User interface has some funny priorities to what's easier
It still crashes or fails to load some documents at weird times
Seems to hog memory
No Postscript output.

Mine is a love -hate relationship.

Wordflair III will be great.
Will there be a Wordflair III?

Again, I have much to learn from the rest of you. So I await more opinions.

Bob Komives

[In article <1992Apr14.233632.8797@actrix.gen.nz>,
Roger.Sheppard@bbs.actrix.gen.nz writes ...]

> What a load of Crap, most of that software you list is no longer supported,
> and Flash II is not even out yet, Signum III is in German the ICD utils
> only work with ICD hosts, is this the best you can do...???

Flash II is available. Here is a press release from its publisher.

Missionware Software is proud to annouce the introduction Flash II.
Details for ordering this new program will be found at the end of this
press release, along with some other useful information!

Here's a list of just a few of the new features to be found in
Flash II:

* DO scripts are enhanced. Old script files continue to work
with new features added for support of Flash II's new features.

* DO scripts are no longer needed, however, for automating your
logon process. All board parameters are now set via dialogs.
These parameters are saved in the board configuration file
and automatically configure Flash II when the board is
activated.

* Now permits the use of up to 30 function key macros. 10
macros are considered global, and are accessed by holding
down the Control key and F1 thru F10 keys. The other 20
macros can be programmed separately for each board and are
accessed with the unshifted and shifted function keys. The
macros automatically load when the board is activated.

* Flash II can be used to display, either on- or off-line RLE
and GIF pictures. (Particularly handy on CIS which permits
the use of online graphics viewing.)

* Includes a new Review Mode. Save your online session to disk
and later review it as if you were online!

* Supports the following terminal emulations: TTY, VIDTEX,
VT52, ANSI, VT100, VT101, VT102, VT200, VT300 & Prestel.

* Supports ST, IBM and DEC characters sets.

* Flash II is designed to work on any ST or TT, in any
resolution, from 80 to 132 columns, and 24, 29 or 48 lines.

* A new type ahead buffer is included. It supports up to three lines of text which is fully editable using the cursor, delete and backspace keys. The [Return] key and [Enter] key perform different functions, depending on the configuration. One can be used to enter forced carriage returns into your message, the other is used to send the message.

* You can configure the amount of memory you wish Flash II to grab at startup. Older versions of Flash grabbed everything available. With multitasking on the horizon, you don't necessarily want to do that. You can continue to <Free> unwanted memory once in the program.

* Includes command support for an automatic answer mode.

* New, full-featured GEM text editor with more flexible block commands (you can now start and end blocks anywhere in a line), cut & paste commands, search & replace function, paragraph reformatting, user tab settings and page widths, automatic word wrap & text wrap modes, and much more.

* The editor now permits you to select the type of display mode desired. Whereas older version of Flash always displayed carriage returns, you can now turn those on or off, as well as all other control characters.

* Almost all menu functions have keyboard equivalents, such as Alt-L to "Load" a file. Where appropriate, these keyboard equivalents match the terminal mode keyboard equivalents.

* Includes Silent Line, a new background file transfer program (replaces "Shadow").

* Internally supports the following protocols: ASCII, Xmodem, Ymodem, Ymodem-G, Zmodem, Modem7, WXModem, CIS B+, Kermit, SEAlink, and Telesoftware (for Discovery/Prestel systems).

* Includes a new "Statistics" feature. Keeps track of all of your online time and upload/download information, and calculates your fees based on the BBS' rates.

* Includes built-in timing functions. Flash II will autostart an online session using this timer.

* Includes a totally rewritten, 226 page manual, fully indexed along with a table on contents. The manual includes a tutorial, detailed section on all functions of the program, and a 50-page section explaining (with examples) the DO script language.

Here's the deal for ordering your copy. We'll accept orders for Flash II using any of the following methods:

1) For outright purchases (meaning you aren't going to upgrade from an older version), the price is $49.95 US plus $4 shipping and

handling. You can order via:

a) Telephone: 708-359-9565. If we don't answer, just leave
the following information on the machine and we'll process your
order: VISA or MasterCard number, Expiration Date, Name, Address,
City, State, ZipCode, and phone number. Your charge card will be
billed on the day we ship (which may not be on the day the order is
received, but it *will* be within a day or two! :-). If you want us
to call you back to confirm the order before it is place, please note
that on your message.
b) Mail: Your can, of course, mail order your copy of Flash
II. We'll accept VISA or MasterCard, with the information included
as noted above, or you can send a check or money order (in US funds
please) in with your order. Please do NOT send cash. Although I
don't mind receiving cash in the mail, it's really not a safe thing
to do.
c) Email: Email orders to J.TRAUTSCHOL will be accepted as
if it were a telephone order. Naturally, you must use a charge card
for payment. I'll confirm your order also via Email, and will not
charge to your card until we actually ship.

2) To upgrade from ANY old version of Flash, you must send us your
old Flash disk as proof of ownership. It will be returned to you.
Since we need to see proof of ownership for upgrades, you'll have to
do the mail order thing here. Upgrades are $30 US plus $4 shipping
and handling. You can pay using either check, money order (in US
funds) or VISA and MasterCard. When upgrading, you receive *exactly*
the same package as those who pay the full amount.

For mail orders, our address is:

Missionware Software
354 N. Winston Drive
Palatine, Illinois 60067-4132 USA

For those of you that sent me your address, you'll be receiving a
newletter soon (I hope) with basically the same information in it as
posted above. I'm starting to work on that information sheet now,
and once it's done and I get the mailing labels printed, I'll get it
sent out...hopefully within a week.

We're working on a demo version which we'll post on the various
bulletin boards as soon as we can. The demo will be as functional as
we can make it, and will be time limited for your online time, and
will probably prevent you from saving some files. Again, as soon as
we can get it done, I'll get it posted here for you. I know you're
all anxious to play with the program.

One other thing. Since Flash II is a brand new program, newly written
from the ground up, we figure you'll find some problems that our beta
testers missed. Because of that, we'll be offering a free maintenance
upgrade about 3 to 4 months down the road for all current owners.

You'll need to ship us your master disk. We'll put the new software on it, and ship it back to you at no cost. If the upgrade can be done by posting a patch program, then we'll do it that way. In any case, we want to make sure that all of your problems, if any, are resolved as quickly as possible so that we can move on to the many enhancements already on the list of "things to do" for future upgrades.

Also, if anyone has a special requirement of some sort, or runs into a problem with, say, a terminal emulation mode, we'll try to get you on as a beta tester for future upgrades. That way we'll be certain to get fixed whatever problem you run into.

Again, thanks for your interest an patience. We'll process your orders as quickly as we can, as well as answer your questions to the best of our ability. We're trying to get the author of the program, Paul Nicholls, on GEnie. However, for those of you on CIS, Paul is there already. We'll be setting up support for the product there as well.

John Trautschold
Missionware Software

I'm sorry to hear that. I guess you don't have a hard drive then?
One of the best things I ever did for my ST was upgrade to TOS 1.4
(1.04) I was tired of not being able to run programs like Gemini.

This is a little off the subject, but, oh well! Have you even seen
the ST Book? I played with one in Chicago, and it was really nice. I
like it better than any DOS laptop/notebook. I can live with the fact of
no internal floppy, since it makes it a lot smaller.

>
>No, no, it was Nolan Bushnell all right. The inventor of the video game, BTW.

A little picky here, but Bushnell developed the first coin-op
video game; he didn't come up the entire concept. Slug Russell's
Space War could probably be called the first video game. And
Ralph Baer did some work in the sixties with paddle types
of games which could be played on a TV. Bushnell's first two
games were a clone of Space War (Computer Space) and Baer's
paddle game (Pong).

Another poster was trying to remember what games Chris Crawford
did for Atari. I can recall Eastern Front, SCRAM, Energy Czar,
and Excalibur. He switched from the Atari 8-bit computers to
the Macintosh around 1984 and he still works on that machine
(Balance of Power, Trust & Betrayal, Guns 'n Butter, etc.).

3837. RE GALAXY CAD

Newsgroup: comp.sys.atari.st
Date: 1992-04-15 15:09:39 UTC
From: ganea@inmos.co.uk
Message-ID: <1992Apr15.150939.19656@inmos.co.uk>
Source record: 223418

Hi EveryOne

I tried running Galaxy Cad on my TT machine (2 Meg ST Ram
and 4 Meg TT Ram).
I got a Boot strap loaded message followed closely by 2 Bombs,
(Bus Error !!). Has anybody been able to get this program to
work on the TT. Is anybody out there able to do a port of the
ST spacific bits to the TT machine, and sort out the 'BUGGY'
user interface at the same time ????
Has anybody tried the Mac version on the TT using Spectra ??

3838. High density 3.5" floppy drives on ste's

Newsgroup: comp.sys.atari.st
Date: 1992-04-15 15:19:55 UTC
From: be824@cleveland.Freenet.Edu
Message-ID: <1992Apr15.151955.29969@usenet.ins.cwru.edu>
Source record: 223419

What is the final word on high density 3.5" floppies on an atari 1040ste? Will it work? Will it work with Spectre GCR? Will it work with PC-Ditto (1 and/or 2)? Will TOS 1.6 recognize it and use it correctly, or is there an autoboot utility for it? How much does the mod cost? What units a currently working correctly for other users? Bottom line...is it worth it?

>Have you ever been to New Zealand, no I don't think so, so you comments
>are a load of rubish, you are nothing but a Atari bigot, get with it..

Yes, I _have_ been to New Zealand... several times as a matter of fact.
And it's a fabulously beautiful country with _mostly_ wonderful, intelligent,
friendly people... of course, there are always exceptions, right, Roger?

And make up your mind, Roger, first you call me a nerd and now I'm an
Atari bigot? I think "nerd" is probably more accurate since I own 4
computers (Atari, Apple and yes, a 386 clone).

>Atari has just posted 1/4 year loss of 4.4 million...

You sure that was for the last 1/4 and not just the last week? :)
Got any more good news to make Atarians feel better?

>What a load of Crap, most of that software you list is no longer supported,
>and Flash II is not even out yet, Signum III is in German the ICD utils

Uh, sorry, Roger... Flash II _is_ out now. Was released by my buddy John
Trautschold at the Toronto ACE show. Should I quote you... "get with it" ?

3840. Terminal Program Blues

Newsgroup: comp.sys.atari.st
Date: 1992-04-15 16:08:44 UTC
From: jon@chopin.udel.edu
Message-ID: <19573@chopin.udel.edu>
Source record: 223421

I'm looking for a terminal program for the ST that can handle IBM ANSI BBS Graphics. I'm not having much luck.

I've heard that a commercial program called INTERLINK from Intersect Software can handle it. Does anyone know how I can obtain it, though? I don't have the address or phone number of the company, and there's no Atari resellers anywhere near where I live.

Is there any other terminal program that could do what I ask?

Please send replies directly to me, since I don't have access to this list. Thanks for your time.

>that thing feels faster than a 25mhz 68040. Amazing.

Try not to read to much of your own prejudices into what I write.
No where in my post did I compare a NeXT to a TT.
My "friend" is used to Pagemaker and Quark express on '030' Macs,
and his comments were strictly made from the point of view of someone
who uses this software professionally on a day to day basis in a production
situation.
In regards to how the machine was set up and running, it was at the
laergest computer show held annually here on the Canadian West Coast. If a
company wants to showcase a machine to potential buyers under-equiped to
run the software they are demoing on it then they are only shooting
themselves in foot, wouldn't you say?
In marketing, first impressions are everything, and this is a case
where one customer would now be difficult to sell on such a system, where,
if what you say is true, he could have come away from the test unsatisfied
with his current system and wanting a NeXT at any cost, this did not happen.
I have also heard reports that the TT mouse response is sluggish under
Unix compared to an 8mhz ST. Maybe this is a characteristic of 'X's mouse
handling routines, I don't know, as I haven't had the opportunity to use
one, but like most people, if someone who's judgement I respect comments on
something, I tend to listen and remember their comments.
On the other hand, I tend to discount statements made by people who
flame anything at the drop of a hat. (Hi Greg)
When you read a post from some college student saying that the ST has
no professional level dtp software, then you read a reply from someone who's
been in the publishing/newspaper business for >10 years saying they don't
know what they're talking about, who would you beleive.
Having been in the pro audio business for >10 years, when I read
statements from Atari saying performing musicians don't need backlit
screens on stage, I have the same reaction.
If I had the money and the need for an '040' machine running some kind
of Unix-like OS, I'd definately look at the NeXT before say the Mac Quadra

running AUX. This again is based on comments I've read, and who they've come from. However, as I don't qualify for educational discounts, I'd also look at the risc machines from SUN, HP, and even at a '486 EISA machine running one of the well known Unix os's.

Hello.
This may be a FAQ, but I'm looking for the GIF ('89 and '87) file format.

I tried some GIF viewer (Viewgif 1.2, zum beispiel) but it cannot handle the TT low rez and med rez, and that's a pity.

SO I plan to write a gif-viewer which can do it, and I will add a JPEG encoder/decoder.

Thanks for any input.

Vincent.

PS : I have no CompuServe account, but I do have free ftp.

Mr. Sheppard, this is the last time I will respond to your flaming, childish, demeaning statements.

First of all, all the programs I listed are still being supported, perhaps with the exception of VIP Professional. Flash II IS indeed out, and has been for over two weeks. If you read the BB on GEnie, you'd know it. STalker is about to be upgraded to version 3.02, and NeoDesk 4.0 is in the works. I'm on GEnie EVERY night, so I know these things. My facts are straight, and you are terribly misinformed, or you are too arrogant to care.

You obviously don't have anything better to do than to harrass us, and frankly, we're sick of it. Go get your PC, sell your Atari, or throw it out, as it seems that's what you'd like to do. QUit making these ludicrous, unfounded statements.

Stick that in your PC and smoke it.

Message-ID: <1992Apr15.182737.13821@usenet.ins.cwru.edu>
Source record: 223429

Sounds like a pretty good deal... BUT, if you don't want a hard drive,
or don't want a monitor, I know two places with better prices:

Computer STudio in Asheville, NC: Mega STE 1 -- $619 +$10 shipping
800-253-0201

TOAD Computers in Severna Park, MD: Mega STE 4 w/50 meg hard drive
800-448-TOAD $1089

I bought my Mega STE 1 from the first place and added two 1 meg SIMMs
that I bought from MacSystems for $33 each (100 ns). They're at
800-942-6227.

3849. Emulators for the ST

Newsgroup: comp.sys.atari.st
Date: 1992-04-15 18:55:36 UTC
From: krakover@spot.Colorado.EDU
Message-ID: <1992Apr15.185536.4794@ucsu.Colorado.EDU>
Source record: 223430

Firstly, I'd like to thanks all of you that send me a response about emulators for the ST. But all the information I got poses a second question. I found that the current price of Spectre (Mac plus emulator) runs about $300-$400, but you can pick up a used Mac plus for $300-$400, is there any advantage to having the emulator over the real Mac, except for saving desk space? The only one I can think of is that my ST hard drive coundn't be used to store Mac programs as would the emulator would let you do. Or is there a way to use one hard drive for two computers?

Thanks,
Jonathan

Wellllll... I'm 90% sure that that price does include the $1000 monochrome monitor. I don't have the info with me now that I got in person at the Chicago Atari Show last November. That means I was told that the price without the monitor is $1500. I was also told that it is supposed to be ready this spring (i.e. - Now!) and that they are also working on a color version...which is great since many people may have just the color monitor. Also, it comes installed on a 230 meg hd and a 300 meg hd is an option. Apparently, only developers have it here in the U.S. right now.

Roger,

You *really* must accept that Atari exist outside of New Zealand.
Wordprocessors such as Calligrapher (WYSIWYG, tables, multifont, graphics
import, line art, spell check/thesaurus/grammer check etc.), That's Write,
That's Word, Wordperfect, Wordup, Protext, Wordflair, Wordwriter, 1st Word
and so on are all available and have been for some time.
Databases? How about Superbase Pro, Superbase Personal, Prodata, Adimens
and more.
Spreadsheet? VIP, K-Spread 4 (accesses Teletext too), Logistix, LDW Power.
DTP? Calamus SL, Pagestream (Postscript, many types of fonts standards),
Timeworks, Fleet Street 3 and others.
Graphics? DPaint + many wonderful packages which others have already mentioned-
.
Add Postscript emulators, video/audio digitisers, scanners, memory upgrades
beyond the 4meg, 68030 boards (outrun a TT!), 24bit graphics boards,
19inch monitors with superb resolutions, and of course UNIX. I can go
out tomorrow and buy this from Atari. It Does Exist.

>choice between ethernet and video adaptor. ACSI devices aren't

Hasn't anyone made a bus-expander? I remember hearing (many moons
ago) that it shouldn't be too hard to design/build an extended bus (ie.
extra connectors/slots) but that because of the way the VME was implemented
it would not support bus-master cards. I should think that this would be a
rather popular (=customer demand) item considering it could be used in TTs and
MegaSTes, not to mention any new machines that Atari comes out with (it
doesn't look like VME will be phased out any time soon). Who wants to get
stuck with the stock video? Who wants to have to decide between 1024x768x24bit
color and an ethernet connection - a truly miserable choice (but I wish I had
that choice :).

>appropriate for UNIX because of the way the ACSI bus hogs the processor
>(Atari is, I believe, fighting off having to support the ACSI laser

I heard about this Monday when I called 8 Atari dealers lookig{ for a Mega STe (4 meg, no HD)
> example:
> one store, nameless, offers

> MEGA STE 1 $849
> MEGA STE 2 $899
> MEGA STE 4 $989

One (nameless) dealer offered me a mega STe w/the setup I mention above for $749 (but they didn't expeft to get them in stock for a couple days). The next best deal was $799 and shipping w/in 48 hours of the order being placed. Hopefully I'll get it by Friday... %-).

> Add a 50 meg hard drive with 19ms for $100
> Add a 68881 co processor for $79
What is the market price for one of these ? I'd love to get it.....

> These prices are current. BTW, this is an ATARI deal. They are sponsoring
>this package deal. $1250 for a color 4 meg MEGA STE is a really good deal.
>Not to mention, the prices are dropping. Something like this is what to watch
>out for.
It looks like a great deal, except I already have mono & color & a larger HD etc. Just needed a replacement machine (ie. CPU).

>Mark Santora
> My name is Mark, but my friends call me Mark...
> Founder D.D.I. Productions
>

If anyone is interested in the 8 dealers & their prices ask by e-mail. No need to clutter this group with such short lived information. (I asked each dealer (I think) about 4 meg STe's and Mega STe's - CPU only.

HELP PLEASE,
A friend of mine is trying to get his old ST from TOS 1.0 upgraded
to TOS 1.4. Well little did he know and as well as me, the ROMS don't
exaclty fit, is there a fix for this?
Another question that is un-related, can a regular serial mouse be modified
to work with the ST, the modifications would require 3 buttons to be wired
to a system of 2 buttons. The reason for this question is that, I already
had to go through 2 Atari mouse and decided it was just getting too costly,
a serial around here is $12.00, besides I would have to mail-order and be
forced to wait for and not use the ST for awhile.

Thanks,
Jeff

Does this have the same problem that all GDOS type program have, you
nead 2 lots a fonts, one for the screen and one for the printer,
plus you can't load fonts on the fly, only at run time...!!!

What has bean stated about Flash II and what realy happends are too different things, I have many time ordered software from good USA firms, but to find that it took some 6 months to get, they never stated a real shipping date, if you noticed from the Flash II text they are taking orders, they don't state when they will be shipping at all..

I have a lot of friends here that are still waiting for there Supra modems that they ordered some months ago..

I live by Facts not Fiction...!!!

Believe half of what you read and nothing of what you hear...!!

This is worth thinging about..

Jeff,

I can recommend Atari Interface (no bias there tho! huge grin).

Atari Interface is monthly, and covers the ST/TT, 8Bit (classic) and the
Portfolio. AIM is distributed to Atari dealers in the US and Canada,
as well as being available in the UK and AUSTRALIA.

Additionally, besides Atari Explorer, AIM is the only Atari magazine
available in bookstores across the US.

A subscription to AIM is $18/yr (US addresses) for 12 issues. Canadian
subscriptions cost $42 and foreign subscriptions are $48/yr.

For more information, contact Unicorn Publications, 3487 Braeburn
Circle, Ann Arbor, MI 48108. Phone (313) 973-8825 voice or BBS:
(313) 973-9137. US funds in cash, check or money order are accepted.
We also accept Visa, MasterCard, Diner's club and carte blanche.

Pattie Rayl (Atari Interface)

Oh, I almost forgot. AIM also offers three different disks of the
Month: ST/TT, Mac/Spectre and 8bit.

>low rez and med rez, and that's a pity.

Try GEMView (it's like XView under Xwindows) - it handles GIFs VERY well,
in all resolutions, even large ones (you scroll it in a window.
It's at atari.archive.umich.edu

>SO I plan to write a gif-viewer which can do it, and I will add a JPEG encoder/
>decoder.

Good idea, except you can convert JPEG to GIF without losing significant
quality since 256 colours is all you get on a TT anyway (just for viewing
- keep the originals in JPEG for compression and passing on).

I guess you're just not paying attention.

Flash II is OUT. People HAVE it. The Supra modems are OUT.
People HAVE them too. Like I said, I read the ST Roundtable
every night on GEnie, and people actually have these things.

The press release posted earlier is old. Flash II was released
at the TAF show, and upgrades have already been shipped. People
are using it, and loving it.

I know of several people that I've met on GEnie and they haev
the new Supra modems, and they love them!

The stuff exists, the stuff is supported.

It sounds like your friend has EPROMS instead of the standard masked ROMs. In that case, he'll have to do some wiring to make them work. I'm not sure exactly what you do, as there are two versions of the EPROMS, each one requiring something different. I suggest you call Bob Puff at Computer Software Services, or Brad at Best Electronics. They can tell you how to wire the EPROMS.

There is a way to convert a serial mouse from a PC to the ST. There was an article in a past ST Report (or was it Z*Net?) that shows how. Maybe someone knows exactly which one, as most of the issues are available on atari.archive.

In response to Roger Sheppard's question about FMSGDOS and Wordflair II.

You can add an subtract fonts in a desk accessory that comes with FSMGDOS.
You can add new sizes of fonts from within the program. This works pretty
well, though I do not do a lot of font changing.

I know what you mean, but LDW Power is a poor example. LDW Power tries to
emulate the Lotus 123 menus, not conform to what standards GEM has now.

It seems, on the same note, that Atari is now only starting to enforce
standards. Clipboard implementation, Control Panel guidelines; there was
some discussion a while ago on GEnie about ALT-X,C,V versus CTRL. Apparently,
the programmers at Atari wanted CTRL -- everyone else wanted ALT. I don't
know what the result is.

On the ST here you can get easy- and fun-to-use programs, try that for the
PC.

Maybe the reason MS-DOS machines need so much support from the developer
is that the programs are so hard to use/install/configure. I get much more
support from my ST developers than I could ever use. I wish I could say
the same for the PCs and Macs at work; I want to use a program, not the
phone, to call customer support.

Maple is a top quality symbolic algebra package. Think of any other competetive name in the field, and I think you will find that Maple has the mathematical edge. Sadly, the latest version that I know about is for the Atari is not the latest, but one can still get Version 4.2. This is still high quality stuff, and you will not likely outgrow it, even through your graduate studies in mathemtics or engineering. It is used by a large group of researchers throughout the world, and there is good support.

This note came from someone associated with the project.

>From jbrennan@daisy.waterloo.edu Mon Feb 25 09:28 EST 1991
Date: Mon, 25 Feb 91 09:28:24 EST
From: Joyce Brennan <jbrennan@daisy>

Maple 4.2 is currently available for the Atari. The price for a single user copy of this program is Can $475. Site licenses are also available. If interested, please ask for details.

You will need at least four megabytes of disk space on the destination drive (space for at least 150 folders).

Thank you for requesting information about Maple. Please send me your full postal address, including university/business affiliation, and phone/Fax numbers, and I will mail a comprehensive information package to you. This package should answer most, if not all, of your questions. If after receiving this information package you have any further questions, please do not hesitate to ask.

Would you please tell us how you learned about Maple. Was it through a colleague or through one of our programs: advertising, direct mail, card deck, conference or editorial coverage? We also welcome all customer comments about Maple. Our technical team considers these carefully for all improvements and updates to the product. Thank you for your help.

Don't forget STevie.

All of these programs are just a tad less than vi in one way or
another. One uses disk support rather than free Ram space,
even though the Ram space may be abundant. Some safety in
that, I suppose.

No, Wordflair II has FSM/GDOS which means Font Scaling Module Graphic Device
Operating System. This means that all the fonts are represented as
vector objects instead of original bitmaps as in original GDOS and many
IBM fonts (for MS-Word, for example). Here, any font can be scaled to
any size and there is no need to have separate screen and printer fonts
because there are drivers to scale and output the fonts to a variety of
devices.
In addition, like you mentioned it is possible to load fonts on
the fly, just depending on your memory. FSM comes with an accessory which
lets you create new fonts, add existing fonts to the 'active' list, etc etc
without having to modify the assign.sys file as in GDOS and/or reboot or
anything. It's all done very easily from within your GEM program as a
desk accessory.

BTW anyone who is interested, there is a review of FSM/GDOS in the
March/April 1991 Atari Explorer, and Wordflair II in the September 1991
issue.

Happy word processing!

My 2 STs (both TOS 1.0 both now 1M) both show their normal amount of memory at the desktop (as reported by NeoControl and/or Intersect), but, after booting a program of any size, show 37548 remaining.

I've tried re-seating all the socketed chips on 1 ST, and I've just run the VKILLER suite on the other (it first said "HolyCow, are you infected! Shut down and reboot") , sanitized some disks and installed a bootsector rastor display. The supposedly sanitized disks still show this magic 37548 remaining memory after running any program.

I'm confused and battered by this. I'm thinking of scuttling down the lines before my Atari empire completely sinks. Any suggestions (including going to MSDOS!) appreciated. Thanks j harris/fairbanks

3883. Word processors, copro and memory

Hello. Some answers :

1. The best word processor I know is "Le redacteur" from Epigraph. It is quick has footnotes, mailing, fonts, graphics, math formulae, etc... capabilities. It can also import/export files with Microsoft Word format.
The only drawback is that this WP is designed for the French and uses French keyboard.

2. Unfortunately, you have to insert a GAL in the mega STE to get your 881 running fine. I have the JEDEC file. I will post this and the debugged High-density PAL tomorrow or maybe Tuesday.

3. To reduce memory size form 4 to 2 megs without disturbing your ST, one can, at boot time, put $1f.ffff in the system variable which designs the end of RAM. Unfortunately, I have not the address here, but I will post it this afternoon.

Vince.

3885. Problems with a HD drive in a Mega STe

Newsgroup: comp.sys.atari.st
Date: 1992-04-16 10:26:21 UTC
From: reeuwijk@dutentb.et.tudelft.nl
Message-ID: <1992Apr16.102621.15973@donau.et.tudelft.nl>
Source record: 223367

This is a warning to all people considering installing a HD drive
in a Mega STe: not all Mega STes are suitable for this.

The dutch company 'ATIN' sells a 'HD upgrade kit' for the Mega STe
which consists of a HD drive and an instruction leaflet. According to
the text in and on the box, it fits in all Mega STes, although
some might require a replacement disk controller. This did not work
for me, and ATIN now tells me that they have discovered recently that some
Mega STes require a more extensive modification.

The man from ATIN could tell that my Mega STe requires modification from the
first part of the serial number on the bottom. For my computer this is 'A1 13'
(these characters are stamped, not printed like the rest of the serial number).

According to him, the modification was too difficult to describe easily,
so he did not tell me what is was; he told me to bring my computer to
them. Since I don't want modifications like that in my computer, I did
not insist, but I am curious.

I have given up on the HD drive for now.

Conclusion: even for a Mega STe, changing to a HD drive might be complicated.

Sorry. All Overscan modifications (the old & cheap one and the commercial
Autoswitch OverScan) do not work in ST'E' due to the changed hardware.

I'm not familiar with Laser C, but if it has 16-bit ints, then the above
code takes the low 16 bits of the address malloc is trying to return,
sign extends it, and puts it in n, with a value nothing like what was
intended. You should add the line:

void *malloc();

to specify that malloc() returns a pointer.

There may be a header file <malloc.h> that you can include instead.

3888. Re: Why are there NO GL-Viewers for the ST ???

Newsgroup: comp.sys.atari.st
Date: 1992-04-16 12:12:26 UTC
From: Klaus Ottradovetz <PT184@DMSWWU1A.BITNET>
Message-ID: <92107.121226PT184@DMSWWU1A.BITNET>
Source record: 221707

There is one such program, as you may see in the posting i copied below.
Allthough it's not mentioned, there is also a version for the st and it works
fine. Besides a preview it does pixel (IMG) and PCL (Deskjet, Laserjet)
output.

Sorry, but the posting is in German, for those who won't understand, here's
a brief summary: Hp2xx is a hpgl to xx converter, where xx stands for:
img, preview, tex, pcl.You will find the adress for anonymous ftp in the
text below.

*** Original posting ***

Liebe Fans von hp2xx, dem HP-GL Konverter:

Es gibt - rechtzeitig zur Hamburger DANTE-Tagung -
ein neues Release, allerdings noch ohne aktualisierte
Dokumentation und noch im Beta-Stadium (was die neuen
Features betrifft).

Die neue Version ist gruendlich ueberarbeitet und enthaelt
etliche lang vermisste Eigenschaften. Dazu zaehlen u.a.:

o Ein robuster Scanner (manche HPGL-Quellen machten
frueher Aerger)

o Kreise, Kreisboegen

o Font-Unterstuetzung (nur Charset 0) !!!!
(Ich habe mich ueberreden lassen, das von vielen
vermisste LB-Kommando und was so dazugehoert einzubauen)

o Seitenweise Bearbeitung von HP-GL Dateien, die
mehrseitige Grafiken enthalten. (Kommando PG;)

Ferner experimentiere ich mit zwei neuen Ausgabe-Formaten, naemlich

o -m em (emTeX-specials zum Linienziehen)

o -m tex (Linien mit \drawline aus dem epic-Style)

Damit duerften wohl die meisten Kompromisse zur Grafik-Einbindung
unter TeX durch hp2xx versorgt sein, und jede(r) kann nun selbst
entscheiden, welches Teil die Hauptlast der Grafiken tragen soll:
TeX selbst oder Metafont oder die dvi-Treiber - je nach Verfuegbarkeit.

Die neuen Features sind noch im Test, und ich lade alle Interessierten
ein, sich die aktuellen Binaries zu holen (s.u.) und mir noch
verbliebene Bugs zu melden. Die neuen Modi (tex, em)
sowie das Font-Handling enthalten sicher noch ein paar Ueberraschungen...

Die jeweils aktuellen beta-Versionen sind via ftp erhaeltlich auf:

```
% ftp clio.rz.uni-duesseldorf.de (134.99.128.3)
Username: anonymous
Password: your_name
ftp> cd hp2xx
ftp> dir
ftp> binary
ftp> get ...
...
```

Wie bisher bereits gibt's dort Binaries fuer
-- DOS
-- Sun/SPARC
-- Convex (C210)
-- HP9000/3xx
Bitte wenn moeglich ausserhalb der normalen Dienstzeiten uebertragen;
der arme Hostrechner ist mit I/O schon reichlich belastet - danke!
.. (some stuff deleted) ...
So, das waer's. Hoffentlich sind nun die meisten HP-GL Dateien ohne
Probleme in TeX-Grafiken umsetzbar. Viel Vergnuegen mit hp2xx!

-- Heinz Werntges (heinz@biokyb.uni-duesseldorf.de)

3891. wordwriter disk writes

Newsgroup: comp.sys.atari.st
Date: 1992-04-16 14:19:57 UTC
From: jtrimble@sdf.lonestar.org
Message-ID: <1992Apr16.141957.13603@sdf.lonestar.org>
Source record: 223371

My wife and I write together, each using Timeworks WordWriter on separate ST's. We continually run into a problem which we haven't been able to nail down. The problem only happens when we're working together, and after we've swapped disks, though often it is long enough later that we've forgotten exactly what steps we took with each swapped disk.

We swap disks to look at/make changes to one another's pieces of the project. Often, we have two disks working that have many of the same file names, though not necessarily completely identical files on each. Even files with exactly the same information could probably be on different segments of the disk.

Sometimes, when we get going fast and furious on the same story, we wind up unable to save to one disk or another. We get a message approximately like: "Cannot find file to write. Check to see if disk is write protected or in place." It's in place, and it's not write protected, but viewed through Mutil, a disk utility, it does seem to have some parts of some files overlapping other files--more specifically the files we want to access or save to.

It's very aggravating.

We have a theory which we've been unable to field test because the problem always seems to come up when we're writing fast and furious and swapping disks and saving so many times that day that we can't remember every step we took every time.

Our theory is that somehow one or another of us does/has done a "Save" without first opening some file from the disk. (In WordWriter, "Save" doesn't give you a file selector, while "Save as..." and "Save as ASCII" do.) We theorize that the computer doesn't know we've changed disks, and so it prints_to_disk where it "thinks" the file is supposed to be, i.e. where the file would be if we hadn't swapped disks.

We have the "Save" habit from way back before we had two computers, so it's hard(impossible) to remember to use "Save as..." all the time.

Does this sound like a plausible explanation for our trouble? Does anyone know of a desk accessory or such that forces the computer to always check the disk somehow before it prints a file to it, and to make sure that it (WordWriter program, the computer, or whatever) checks for more than just the file_name, but looks at

sectors or tracks or whatever it is that keeps it from plopping
the one file down on top of another?

We only swap single-sided disks. We don't have and can't afford a
hard drive, (and not having it, we can't share it in case that's
the solution you're going to suggest; thanks, but we've thought of
B
it already.)

Thanks for any suggestions e-mailed to jtrimble@sdf.lonestar.org
If there are enough--or one that works--I'll post a summary.

Flash does not provide VT2xx support. I think you already use the best ST program for this (Uniterm). What exactly do you mean about the delete key? Uniterm allows you to swap the backspace/delete keys.

3895. Re: Problems with a HD drive in a Mega STe

Newsgroup: comp.sys.atari.st
Date: 1992-04-16 15:50:43 UTC
From: hutch@bellman.lanl.gov
Message-ID: <1992Apr16.155043.10398@newshost.lanl.gov>
Source record: 223375

That's interesting. I thought the only problem with installing a HD in a MegaSTe0 was that you had to mill away the plastic reinforcement in the case where the HD usually goes. But I thought the HD controller and cables were in there already.

Some great buys on MegaSTe machines right now folks (a lot cheaper than what I paid as a "good guy Atari developer" last year). If your old ST is worn out or if you are looking for a new unit, you could do a lot worse for the money. As a minimum, everyone should jump for CodeHead's TEC board (or a similar unit from someone else) because TOS 2.06 is an even bigger improvement than 1.4 was over 1.0. You might want to opt for the switchable TOS option though, as with any new TOS variant, some old favorites (mostly games) don't like 2.05 or 2.06.

krakover@spot.Colorado.EDU (KRAKOVER JONATHAN DA) writes:

>>is there any advantage to having the emulator over the real Mac,
>>except for saving desk space?

It depends on what _kind_ of Mac you are comparing it to. I'd say that in comparison to a "real" Mac Plus, you would be better off with the Spectre GCR (given that you already have a working ST with at least 1Mb RAM and a decent monochrome monitor... running on a color monitor is awful!). The Spectre is between 20-30% faster than a stock plus when running on an 8MHz Atari (even faster on 16MHz and better Ataris), you have a slightly larger screen and perhaps a few other bennies. The cost differential, however, is not what it used to be. Used Mac Plus's for $500 are not unusual which is about what a new Spectre GCR with genuine Apple 128K ROMs will cost you.

The Spectre is a really neat hack and I still use mine on occasion even though I have a real Mac as well. System 7.0 support is not here yet but Dave has promised it... sometime RSN. Just remember, that the Spectre GCR emulates a Mac Plus and _not_ a Mac II. Keep that in mind when you make your comparisons.

With FSMGDOS you can load and unload fonts on the fly. And from
what I understand, it has only one font file for each font.

>color and an ethernet connection - a truly miserable choice (but I wish I had
>that choice :).

There's at least one company in Germany that repackages the TT board into
a box of their own design, that includes a 4-slot 3U VME cardcage.
The drivers one the board won't handle more than that, and you still get
onlt A24/D16. It looks awfully industrial, not the sort of thing I'd
like on my desktop, but, hey, if you need more slots...(I had forgotten
all about this when I made my original reply).

>>... but it you know of a good SCSI Ethernet, I'd

Source record: 223384

Well, I got it, and I configured it, and I've gotten things to run and I've gotten things to compile fine. Wonderful work, guys.

Questions, though:

I had read, in some file, somewhere (with the MNTLIB19 dist, maybe?) that the MiNT libraries weren't yet compatible. Is this true? Or do they just need to be recompiled?

Second, in trying to port Less 1.77 (pretty easy) I found that the PL 72 libs (and MNTLIB 19, btw) 1) don't conform to either the BSD or SYS V regexp function names (re_comp and regcmp--PL72 uses regcomp, I think) and, 2) when I tried to link all this together (after changing appropriate names in the sources) I got an error, "regerror.o not found".

I got Less up and running without regex stuff, but I'd like to figure out what's wrong and recompile. Maybe this has all changed--I have the library sources, now, so I can check myself. Just wanted to know if someone else knew anything.

Mike.

Source record: 223386

Okay, kids, here's the score:

For a while, I was able to support Heat-n-Serve because I had a BIX account and could get in touch with Ian Lepore through that.

Well, I'm also in college, and couldn't sustain $500+ a year, as much as I enjoyed it.

Well, there's another guy who's on BIX who just got an MCIMail account, and he's volunteered to act as a clearinghouse for bug reports. You can still get answers out of me, or Steve Yelvington (I just figured how to *post* to c.s.a.s, so now I can speak up), or any of the number of knowledgable people out there, but Bob Goff is the only way to get *to* Ian. So if you have a bug report, send it to 0005290822@mcimail.com, the name's Bob, and be sure you UUENCODE binary stuff. Be very sure.

Enjoy,

Mike.

>One uses disk support rather than free Ram space,
>even though the Ram space may be abundant. Some safety in
>that, I suppose.

Elvis uses temporary disk files as does "real vi". This makes it possible
to recover all but the latest editing change after a system crash. It also
tends to keep the memory usage constant which is helpful when multitasking.
I have my mint.cnf set up to automatically check for and recover editor
files upon system booting (similar to vi under unix).

Two suggestions for elvis users:
1) If you don't have a hard disk or just want to use ram for files,
set up a ram disk and point elvis's tmp files to it.
2) If you are using a hard disk and MiNT: Set up a tmp directory on
a minix file partition for elvis files. Then in your elvis.rc,
add the line "set nosync". This will make file changes faster,
eliminating occasional delays. (Reason: TOS files must be closed
and reopened to make sure current changes are flushed to disk--
this has to do with updating the TOS file-size field. Under TOS,
elvis has the default "set sync" which sets the constant updating.
Without this, file recovery breaks. With a minix file system under
MiNT, however, the tmp files remain consistant with "set nosync"
and the delay is eliminated).

There is one more, it's compatibility system in Boulder, CO.
Don't have their phone and address handy, but them should have ADs in Mac type magazines.
As the price, they typical listed for $495 or less and mail order price is about $400. However most of them has 50% or so of educational discount for school, which bring the price down to $250 to $300 range.

They use the SCSI bus to transmit information between the computer and the Ethernet, so it needs to share the SCSI bus witht other SCSI device (mainly the hard drive). This sometime will limit the overall transfer rate, but for most application they performed quite well.

There is no softwrae for ST to drive such SCSI-Ethernet device, otherwise it would be a good way to add Ethernet access to ST, TT etc. Once the drive is availible, then the NCSA telnet shouldn't be not far way from porting to ST.

We have 4 or 5 of the compatibility system's SCSI-Ethernet boxes for the Macs in the department. They are a small box of 5" X 6" X 1.5" in size, powered by a DC wall plug supply, a 25pins SCSI connector, a BNC connector for the thin net, a thicknet connector. It can tie to thin, thick and twist pair type

Ethernet wiring. And internally has 32K(or 64KB, forgot the number) buffer. They can easily installed to any Mac with SCSI port (or any machine with SCSI port, but if I remember right, they only have Mac driver and maybe IBM and Unix but certainly not ST).

Date: 1992-04-16 22:15:10 UTC
From: cbbrowne@csi.uottawa.ca
Message-ID: <1992Apr16.221510.7499@csi.uottawa.ca>
Source record: 223391

The idea of having 16 million colours (24 bits worth), that are simply "chosen" rather than using a palette sounds neat, in SOME ways, but is it ultimately ALL that great?

(Note: There WILL be an implicit palette, made up of 16M colours, in which the entries are fixed. Looking at it this way is probably useful in critiquing the idea of "True Color". It should be noted that I am NOT a graphics programmer, and people who've done such things should be the ones that continue any subsequent discussions... Also, as a Canadian, I kind of like British spellings, like "colour" versus the "color" used by those people in North America that live south of the 49th parallel. We're ALL Americans, whether we live in Canada, Mexico, or the United States. Of course, the "Americans" that live in Canada get better service from Atari, but that's another issue!)

1) It means that if some of those colours never get used, whether in a particular application, or possibly EVER (who'd want THAT putrid shade of green?), then that part of the implied palette is wasted. It might be a better use of resources to have a smaller palette that contains the colours that are actually USED.

2) I have often seen palette switching used to do animation/"editing" of pictures. You change colour #1 from White to Black, which seems to be a pretty useful thing. "True Color" seems to throw this sort of feature away.

Any comments from people that are more involved in graphics?
Could the "True Color" mode be merely one of many, where the OTHERS would have palettes?

Dear Netters,

Since apparently we can't hold our breath waiting for FSM-GDOS,
I'll have to settle for something using GDOS. So does anyone
know of any GDOS symbol fonts? Commercial or PD offerings, either
one is just fine. I really need to be able to type special
characters like greek letters, inequality signs, etc.

Thanks in advance,
Jim

Besides my old friends calling me cpu geek, my wife also as well now (of
course she's joking, I hope).
By the way I got some of my old friends totally interested in computers, by
showing demos that they would never imagined existed, but like some of them
they are interested in arcade games.

>Ah, some of us just can't seem to get enough, can we Jeffrey? But my intention
>was to imply that a true atari BIGOT (as I was called) wouldn't be caught dead
>with anything _but_ an Atari. Me, I like 'em all... just can't afford 'em.
>

Well actually enough is what I said, I had the 2 8 Bit ATARIs since I was
12, and still plan to keep these hopefully forever. I jumped into the ST
for school and then the 486 for difficult planetary simulations, later
the notebook was a great idea, since I work with a professor in development
on the pc simulation. The 286 came in for free and the MAC LC II came in last
2 weeks ago. I figure buying a 030 card and a hard drive and a graphics
card for the ST would be more than just buying a MAC 030 already in. The
286 is going out and the ST will be as well when the GEMULATOR comes out.
I hope to get rid of the MAC as well as soon as I learn more on programming
graphic applications on it.

I like to say thanks for all the replies for the ST magazine info. ATARI
people always seemed to be one big family. I'm glad I was able to be a
part of this group.

But who decides what's a "good" color? I'm particularly fond of THAT
putrid shade of green...

>2) I have often seen palette switching used to do animation/"editing"
>of pictures. You change colour #1 from White to Black, which seems to
>be a pretty useful thing. "True Color" seems to throw this sort of
>feature away.

The trouble with palette mapping on displays with huge amounts of
color is that it eats tons of memory. Say you have a page of graphics
with 16 million "colors," each actually a logical color number,
essentially a key into a hash table of "real colors." A 1 in the
display memory means go to the first entry in the hash table, pull out
the value there and use that on the monitor. Between the video memory
and the hash table, you've just doubled the amount of memory the
picture takes up -- a not-insignificant amount with 24-bit color.
(Tangentially, you've also slowed things down a little...) On the
8-bit Ataris this didn't cost anything -- four logical colors map to
four real colors. Not a big deal. On the Falcon (or whatever) it
is (or will be.)

> (We're ALL Americans, whether we live in
>Canada, Mexico, or the United States. Of course, the "Americans" that
>live in Canada get better service from Atari, but that's another
>issue!)

Yeah, but you can also be called Canadians, and people from Mexico
can be called Mexicans. Aside from "Americans" our next choice is
United Statesians, and that that just sounds really, really weenie.

3918. CD ROM drives on the ST w/ Spectre

Newsgroup: comp.sys.atari.st
Date: 1992-04-17 04:56:26 UTC
From: ec333way@steam.uwaterloo.ca
Message-ID: <1992Apr17.045626.13078@watserv1.waterloo.edu>
Source record: 223398
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I plan to get Spectre GCR VERY soon & most likely an SST as well (I have to do some Mac work)..
My question is this: Can I hook a CD-ROM up to my ST that will AT LEAST work with the mac? It doesn't necessarily have to do anything useful with an ST, as long as it acts like a normal mac cd-rom..
Would I need a megatalk board for this or will my ICD adapter be good enough?
Also, I've heard that the Mac 1.44 meg disks are identical to IBM 1.44's..
Is this true? Could I, in theory, take a 1.44 meg Mac disk to my PC, read the 1.44 disk onto hard drive, re-write to an 800k and move to my ST? That would be nice as well.. (I assume that copying files from the ST to a Spectre partition IS possible?)..

>two of my partititions (drive F and G)... maybe I am wrong... but I am taking nochances...
After major surgury, I only lost 6 files (whew!)... (thanks, Brian
>T.)
>

I found Cold Hard Cache to be extremely reliable. Perhaps it is something
in your auto folder/acc's that is screwing it up. I would say without
hesitation that CHC is the best cache program in the PD/Shareware realm
(actually, I don't think it is in this realm any more; I believe a commercial
version comes with Diamond Back, and previous PD versions are null and void).

If you have an ICD host adaptor, you can use that software for caching. If
you ALREADY are, this might confuse CHC also!

My favorite thing about CHC was the stats (hit ratio, time saved, etc) you
could get from the companion acc. I was taking an OS class at the time, and
it was neat to see what all the fuss was about (wow, that was many moons ago).

I now use my ICD software for caching, so no more stats :-(.

3921. Excellent new ST BBS software available

Newsgroup: comp.sys.atari.st
Date: 1992-04-17 05:53:41 UTC
From: oracle@iastate.edu
Message-ID: <oracle.703490021@vincent1.iastate.edu>
Source record: 223251

For anyone out there who runs a BBS or has every thought about running a BBS on the ST, there is a new BBS program available called 'TRANSCENDENCE' which is a really nice POWERFUL system.

I would have to say that it has far more potential then the more popular systems like FoReM and TurboBoard. A shareware version is available with a few features disconnected, and it can be registered for $49 (certainly worth it if you have seen what it can do).

If you would like to see Transcendence in action, I have a system set up that you can reach if you can telnet. Just telnet to '129.186.99.31', then at the dial: prompt, type 'me\16125' then follow the prompts. Keep in mind that this is a brand new set up that shows about 20% of what the program can do, and that it is not being used on a modem as it was originally intended. If you are interested give it a try!

P.S. I am not the author of the software, just a happy customer...

>|> From: tjt (Tim Thompson)
>|> Subject: Atari ST version of Keynote
>
>What is Keynote ? some musical software ?
>Send more detail please.

Keynote is a music programming language and performance environment developed by Tim Thompson at AT&T. I think it's primarily aimed at algorithmic music performance, but it has all the real-time support required for regular sequencing tasks as well. There is also a graphical environment with music editor (player-piano roll-style music format) along with the other stuff.

Keynote is somewhat like FORTH in that you can simply add new words to the language by putting together the built-ins and other procedures.

I've been using a beta version of Mike Healy's ST port off and on for a few weeks now, it's pretty stable and I had only a couple minor gripes about it.

If you're interested in MIDI, music, fractal music, other programmed approaches to generating music, etc., Keynote is definitely worth looking into. I don't believe it has support for printing scores in the current distribution, but you could probably learn enough of the keynote language to make a really cool WYSIWYG music editor and playback front end as well. The system as a whole is incredibly powerful, and well worth your time, if you're interested in music. (There's the implicit assumption that you're also interested in computers, else why would you be reading this newsgroup, eh?)

Even if you're just interested in sequencing, recording tracks, etc., keynote has all of that support already. Also, the programmatic approach to music can be incredibly handy. Like say, you define a phrase
a="c d e f g"

You can then perform various functions and operations on this phrase:
a = a + a

Turns the phrase into "c d e f g c d e f g", pretty much as you'd expect.

Or call up something like,
transpose(a, -3)

to take the phrase down a third, etc. Makes global modification of MIDI tracks incredibly simple...

>violation, right ? If you've got the ROM's you've bought a machine, Ha!

Yes indeed... just like the Spectre GCR is a "clumsy hardware
solution" that is "totally uncomfortable to install and use"

And the existing Macintosh emulator board which uses original Mac ROMs
in the PC... that's probably clumsy and leads to incompatibilities too..?

What's your problem with this particular product..?

>processing ANSI C code.
>
I've now received HiSoft blurb about Lattice C 5.5, in which they say
...
"The ANSI compliance of the compiler is strict and complete as far as
we know including support for Trigraphs, Float as a native type and
flexible keyword ordering."
...

Presumably the features mentioned are those that were missing/unreliable
in version 5.0 (e.g., as I remember, "int __regargs foo(bar) {...}"
was fine, but "__regargs int foo(bar) {...}" didn't work before).
For those interested, upgrade costs from v5.0 are --
case UK: <pounds>39.95; break;
case !Europe: <pounds>40; break; /* note the extra 5p! */
default: <pound>45;

According to the blurb, v5.5 includes amongst other things a `Project
Manager' (i.e., an integrated `make'), and >280 pages of new documentation.
A `Toolpac' with CLI make etc. "will be available soon", and HiSoft will
also "proceed swiftly" with the much-delayed Source Code Debugger.

Good to hear about Pure C's forthcoming release outside Germany,
it sounds to be a great system.

I have no connection with HiSoft or any other company; hope the above
information isn't read by anyone as an advert.

Uh, the physical floppies ARE the same but the formats are not. A Mac with a SuperDrive
1.44 can read and write to PC and ST disks (I do this almost every
day) but not the other way around. The ST can read and format Mac disks, of
course, when using the Spectre GCR. And yes, you may copy files from an ST
partition to a Spectre partition but it's not all that straightforward. You
must keep in mind that the Spectre partition is hidden from the ST operating
system. So to copy a file from ST to Spectre partition, you would first copy
the file to a floppy using the Transverter utility (comes with SPectre) or
some similar utitlity, then boot Spectre, then copy the file from the floppy
to your SPectre partition. Convoluted, perhaps, but it works.

>this. Did you use a desktop case or a tower case?

You can do either, it's up to you. You can buy a complete kit from an outfit called Tech-Specialties, 909 Crosstimbers Street, Houston, TX 77022, phone (713) 691-4527. They can even sell you a kit that allows you to put BOTH an ST and a PC motherboard in the same tower case! Pretty trick, eh? One caution however... if you intend to run a Spectre cartridge, make sure you will have access to the ST`s cartridge socket once you've put it in a PC case!

>Did you move a normal ST or a Mega?

You can move either into a PC case but the SST (for now) is designed only for the Mega version. Of course, I think that's only because the Mega is the only ST with enough room to accomodate the largeish SST board so if you put an ST motherboard inside a PC case, that requirement goes away, I would think.

>Should I buy a used mega (ie would it make things easier)?

It's just as easy to remove the screws from a used mega case as a new one. Tell me where you would find a _new_ MegaST now anyway??? (not a MegaSTe).

Sounds to me like you ought to contact Gadgets and talk to them direct before spending large amounts of cash. Their number is 303-791-6098. Their phone is often busy, though, so I recommend you contact them via fax at 303-791-0253.

3930. Minix Filesystem Driver for MiNT Version 0.55

Newsgroup: comp.sys.atari.st
Date: 1992-04-17 14:56:35 UTC
From: shenson@csm.ac.uk
Message-ID: <15822.9204171456@csm.ac.uk>
Source record: 223260

I've just uploaded the Minix filesystem driver and associated tools for MiNT
to atari.archive , version 0.55 . Not a great deal has changed since the last
version (0.541) except file locking code has been added, this feature requires
MiNT 0.94 at least to work. I've also documented the 'fscntl' calls which can
now be classed as 'official' . An explicit 'copying' file is included rather
than saying just 'copyright' as I did before , which might be misunderstood.
Binaries and sources are included in the archive (it should be in
atari/mint/mfs055.zoo).
For those who aren't familiar with this package ,it is a complete
Unix like filesystem driver for Atari ST and can be used as an alternative to
the standard TOS filesystem. It has most of the features you would expect from
such a filesystem, such as hard links , symbolic links , standard Unix file
permissions, setuid/setgid, mixed case filenames (i.e. not 8+3 upper case only)
etc. Also included is an experimental 'long-filename' filesystem feature which
allows filenames longer than the standard 14 character limit. Unfortunately
certain gem programs don't like mixed case filenames not in 8+3 format so
a facility is offered to translate the mixed case stuff into an approximate
8+3 form for TOS, and only 'MiNT aware' programs can really make use of them
fully (like the GNU filetools in atari/mint).
As might be guessed from its name it uses the same format as 'Minix'
and is very useful if you use Minix as it makes Minix partitions (if set up
correctly) behave similarly to TOS ones. It supports the new V2 filesystem
format too.
A warning or two is in order, since the filesystem format is totally
incompatible with TOS all standard TOS filesystem repair utilities are useless.
So if you don't have the editing and repair utilities in Minix be prepared to
make backups ! Having said that I use two minix partitions on my hard drive
all the time and no release version has ever even damaged one, however I ,
I naturally can't guarantee no version ever will.
For more details see the docs in the package itself. Please mail me
any questions/bugs or bugfixes at shenson@csm.ac.uk as I currently can't
read this newsgroup.

>together, and after we've swapped disks, though often it is long
>enough later that we've forgotten exactly what steps we took with
>each swapped disk.
>
Such disk swapping is dangerous and can easily lead to disk corruption.
Whenever the ST detects that the disk has been removed/replaced from
the drive, it reads the serial number on the disk. If the serial number
has not changed (from the last time it was checked), then the ST _assumes_
that the disk has not changed. If you, in fact, have placed the disk
into another computer and modified it, then the ST's assumption is false--
the disk contents have changed and buffered information (directories and
FATs) may be incorrect. Further changes to the disk can cause the
incorrect directory/FAT information to be written to the disk, corrupting
its files.

I believe that you can avoid this problem by always placing another,
unrelated, disk in the drive between swaps. Do a directory listing
on that disk to flush the old disk's info out of memory. Then, when
you replace your original disk, everything is read afresh. I think
for TOS versions 1.4 and above there is also some desktop hotkey that
forces a re-reading of disk information. Maybe someone else can post
what that might be...

>be a better use of resources to have a smaller palette that contains
>the colours that are actually USED.

The main advantage of a "palette-less" system is in image processing. With a direct RGB (or other component) method of image storage, one may process the image by standard, linear filtering methods which use superposition of image intensity and color information. Even non-linear techniques are more straightforward. With a palette system, much translation and untranslation is required, muddling the algorithms. I would venture that with a palette system, most (image processing) programmers would keep an essentially RGB version of the image in memory for processing and convert it to the palette-ized version for display only. In this case the palette is inconvenient and doesn't save any memory.

This is analogous to 12-bit logarithmic encoding of audio as opposed to 16-bit linear. In many ways, 12-bit system can have comparable fidelity and saves memory/storage. However, the linear system has many advantages in filtering and other signal processing.

======================================================================
.
.
.
Cybercube Research Limited
Cybercube of Thornhill, Ont. was there with the CyReL Sunrise M16-1280
graphics card. The CyReL Sunrise is a VMEbus card that gives not only
stunning graphics, but 20Mbit/s networking as well. The CyReL Sunrise
can display 32-bit graphics in resolutions up to 2048x1024 -- non-
interlaced. Resolutions are totally programmable from 256x200 to 2048x
1024 and Refresh rates range from 50Hz to 220Hz.

The CyReL Sunrise was shown running on a TT; the graphics were
impressive, to say the least.
.
.
.

All I can say is : I WANT ONE!!!!

Cheers,

Ben

3940. Falcon specs, February 2,1992 from Atari.

Newsgroup: comp.sys.atari.st
Date: 1992-04-18 16:47:52 UTC
From: elendir@pegase.enst.fr
Message-ID: <1989@pegase.enst.fr>
Source record: 223270

Hi there,
These are the Atari specs regarding the Falcon, as published in a note
dated form February 21st.

CPU 68030 @ 16 MHz.
Optionnal FPU 68882.
RAM : 1, 4 or 14 MB configurations operating in page mode.
ROM: 512 Kb internal, 128 Kb cartridge port.

DSP 56001 @ 32 MHz.
32 KWords (96 KBytes) of 0 wait state static RAM.
DSP connector to allow for modem/fax/voic mail/direct to disk...

Internal direct processor slot for 386SX emulation, or other processors.
Optionnal processor socket.

Super VGA : 640x480 256 colors.
True color 16 bits mode : 320x200 or 640x480, 65536 colors
Accepts external video sync.
15-bit overlay mode for video tiling and special effects.
Programmable overscan
262144 possible colors
Harware assisted horizontal fine scrolling
BLITTER graphics coprocessor

Independant 10 channel 16-bit digital audio DMA record and playback
channels with up to 50 MHz sampling rate.
Stereo 16 bit DMA audio output.
Bitstream 1-bit DAC, 80 times oversampling.
Stereo 8 bit DMA audio input.
RASCAL and SDMA audio signal coprocessors.

SCSI 2 port with DMA
High speed LocalTalk compatible LAN port.
Connector for RVB ST or modulator.
RS 232C serial port.
Bi-directionnal CENTRONICS port
Cartridge port.
MIDI in and out.
Stereo microphone input.
Stereo audio output.
Two joysticks ports.
Two 15-pin enhanced digital/analog controller connectors.

1.44 Mb floppy disk.
Optionnal internal IDE hard drive.

There it is.
Hope you'll enjoy.

Vince.

>recent? Are the authors on the net, perhaps?]

This is probably irrelevant, but then Im good for stuff like that...
I found out a neat trick, pretty obvious in hindsite, but some people
may not know about it...

Using Elvis, I can actually spawn out to shell. Using Gulam, and setting
the environment variable shell to point to Gulam, I use <esc>:sh and
what ho... Pretty handy. Considering the real vi can do the same, and the
amount of time I spend on my unix box, its nice to see that it carries
over :-)

David:

No, the ST version doesn't have a 68881 socket. The whole thing
is totally lame, and so is ICD's support. I won't go into details
just yet. If you want a GOOD accelerator, get one of Fast Tech's,
like the T16, T20 or T25.

3949. MiNT Hardware scrolling

Newsgroup: comp.sys.atari.st
Date: 1992-04-19 03:34:55 UTC
From: u1398@jsp.umontreal.ca
Message-ID: <1992Apr19.033455.11901@cc.umontreal.ca>
Source record: 223279

When I had MiNT running on my 1 meg ST with TOS 1.0, I tried turning on an option called "Hardware Scrolling", and also turned on "Fasttext" mode. Boy was I surprised at the scrolling speed as soon as the shell loaded. How could it possibly scroll so fast? Text displayed and scrolled so fast on my monochrome monitor while running MiNT that it seemed to look like it was "cheating" sometimes: Perhaps scrolling the screen up 5 lines and then quickly printing the 5 lines at the bottom. The scrolling was faster then anything else I ever saw, even Tempus with a window set at 1/4 screen.

(text almost seemed to "appear". Also, there was another option called "biosbuf" which did not seem to change much. What are these?)

I have one thing to say to the people who make Warp 9, Quick ST, Turbo ST, (and perhaps NVDI?): Talk to Eric R. Smith about how it was done, and add it as a feature to your programs;

That way, people who post Quick Index results of:

TOS Scroll: 137% (dismal. Hardly any improvement.)

can now post things like:

TOS Scroll: 500% (who knows.)

I realise that for every line that is scrolled up, the ST has to move 32K, but MiNT somehow implies it is done by "Hardware". Meaning the text must be printed "below" the screen and then the pointer to the physical screen memory is changed. Right??

In any case, its all gone now: I sold my HD.(*) But MiNT 0.92 (?) ran fine on a 1 Meg ST with TOS 1.0. Sure, I could not run NetHack (not enough ram) and MGR did not like the cramped space, but few crashes!

(*) Saving up for a trip to Europe, where hopefully I can go to the Atari Messe. They better have the falcon ready. :-9

Sorry for HEADACHE but if people LOSE $HUNDREDS with PC and Gemlator
then they will get BIG BIG BANKACHE.

3951. Upgrade fever

Newsgroup: comp.sys.atari.st
Date: 1992-04-19 05:49:40 UTC
From: coope@bert.cs.byu.edu
Message-ID: <1992Apr19.054940.753@hamblin.math.byu.edu>
Source record: 223281

I hope the network wise ones are tuned in -- I need some counsel. I would like to upgrade my Mega-2. First, I know I need more memory; some things I want to do right now are hampered. When I try to compile some programs with gcc it does very strange things that I can only guess are caused by running out of memory. (The cassette labelling program from atari.archive won't compile, for instance.)

From looking at the insides of my machine, and examining previous posts, I assume I need 16 RAM chips (1 Meg x 1, reasonably fast) 16 decoupling capacitors, and 3 resistors. At least, I can see places to put those chips on my board after I remove the solder from the holes. Questions:

How fast is reasonably fast? My present chips say 'Nec D421000C - 12' followed by '8834EU002'. Is that 120 ns memory?

What is the specification on the decoupling capacitors? Mine say CGW\n224\nZ5J\n739 which tells me absolutely nothing.

It looks like I need 3 resistors valued at 3.3 ohms (if I haven't goofed on that resistor code.) Are there any other traces/jumpers/components than the ones I mention? There are three spots on the silkscreen for resistors that are not occupied: R71, R72, and R74. I assume that hooking these up would be like enabling the read/write/select lines or something. Is there anything else?

Second, I would like to add a processor upgrade in the future to give me more speed. I've looked hungrily at the discussions of the SST and the TinyTurbo30. One thing I don't know, though, is how well either one of them would get along with my PC-Ditto II. This latter piggy-backs on the CPU chip (it is socketted) and takes up a bit of space inside the Mega chassis. If I got a TinyTurbo30 or an SST, would I have to get rid of PC Ditto II? When PCDII first came out, I thought I heard that several of the CPU upgrades worked fine with it -- does anyone have direct experience with PCDII and ADSpeed, Turbo16, etc.?

Thanks!
So I need a signature....

>

First, there is no evidence here implying that your cousin has any
level of knowledge of experience than me. Second, all local busses ARE
different right now, and until there is a standard, will be so. That
makes zero difference in performance though, as long as you the video
board from the same or compatible motherboard manufacturer. The local
busses on most clones run at the same speed as the processor, so my
local bus runs at 50mhz. I don't know about the one on the NECs. As
far BBSs talking about bugs in the 486, well that is one of the most
ignorant statements you've made yet, and you've made quite a few.

>>>

3955. Installing gcc 2.1 under MiNT

Newsgroup: comp.sys.atari.st
Date: 1992-04-19 14:57:57 UTC
From: terjeve@ifi.uio.no
Message-ID: <TERJEVE.92Apr19155757@kolsaas.ifi.uio.no>
Source record: 223285

Can someone please tell me what I need to install gcc 2.1 under MiNT?
I need to know all the files to get (from atari.archive) and all the
environment variables to set in order to get it to work. I guess I
also need an assembler and a linker.

Thanks!

Hi there,

well, I know this is definitely "off-topic", but I wonder if anyone of you can tell me how to read APOLLO DN 3000(3500) Workstation formated disks on IBMs or Atari STs with an 5.25 inch floppy drive?

Please answer by private mail (you know this is off topic). Thank You.

Frank

Billy,
Just run off of the K1-II thru port. You can run any number of instruments in this daisy chain manner. The only time you would have a problem is if you started to saturate the bandwidth of the MIDI port, which doesn't happen unless your doing "power MIDI" applications, like sending a lot of continuous controller data, sysex, etc on many channels at the same time. See rec.music.synth for an on going discussion on MIDI bandwidth.

Anyway, the answer is yes. Use the MIDI thru from the K1-II. I just put in that bit about MIDI bandwidth to keep the power users off my back :-) We'll see if it works.

Regards,
Doug

: >
: >My wife and I write together, each using Timeworks WordWriter on
: >separate ST's. We continually run into a problem which we haven't
: >been able to nail down.
:
: I believe that you can avoid this problem by always placing another,
: unrelated, disk in the drive between swaps. Do a directory listing
: on that disk to flush the old disk's info out of memory. Then, when
: you replace your original disk, everything is read afresh. I think
: for TOS versions 1.4 and above there is also some desktop hotkey that
: forces a re-reading of disk information. Maybe someone else can post
: what that might be...

In TOS 1.4, pressing ESC at the desktop while the disk's window is
current will force the disk information to be re-read. But I presume
that the original poster and his wife do not return to the desktop
each time when swapping disks. In that case, a safer course is to do
as you suggest -- put a different disk into the drive, and force it to
be read. This can be done from WordWriter by selecting OPEN from the
FILE menu and clicking on the drive letter. If you have just put in a
new disk, you should see the drive light go on for a few seconds.
Then press CANCEL to keep from actually opening a new file.

Let me repeat, however, that if you take a disk out of computer 1,
modify it on computer 2, and then put it directly back into computer
1, without first reading a different disk, you are headed for trouble.
Even though the disk light goes on and computer 1 seems to be
re-reading the disk, it is actually just checking the serial number.
When it finds that the same disk is in the drive as before, it ASSUMES
the disk has not changed and does NOT force the critical disk
information to be re-read. You MUST put a different disk into the
drive and force it to be reread before returning the original disk.

>is totally lame, and so is ICD's support. I won't go into details
>just yet. If you want a GOOD accelerator, get one of Fast Tech's,
>like the T16, T20 or T25.

I have to post a counter to this. I have had an ADspeed in my mega
for >1 year now with no problems, I also use the ADscsi host adapter.
My experience wth ICD has been nothing but good in the hardware
department, and not bad in the support end. I know people with T16's,
and at the time I bought my ADspeed, it had better compatability than
the T16.
I think the reasons for no fpu on the ST version are twofold.
This is my opinion only. One, <1.6 TOS has no direct support for the
fpu, and Two, the number of programs that use the FPU in the <1.4
mode number about 2 or 3. These programs, (DynaCad and Calamus are
the only 2 that come to mind) are the kind that attract users that
upgrade hardware more often.
Anyway, I don't know what this guy's problem with ICD is, but I
wanted to post a balancing opinion.
Usual disclaimers about relations with ICD apply here.

Has anyone run MiNT under one of the 030 accelerators yet? Is
it close to fast enough to do realtime work with one. It seems wth
3 or 4 processesrunning on even a 16 mhz 68000, things slow down a
bit to much for my taste. My reason for asking is I'm debating going
with Linux, but another alternative is to see how MiNT goes as 030's
with MMU's become more accessable. Could memory protection be added to
MiNT?

3964. Wierd stuff with GCC 2.1...

Newsgroup: comp.sys.atari.st
Date: 1992-04-20 00:17:40 UTC
From: MDORMAN1@UA1VM.UA.EDU
Message-ID: <9204200020.AA27954@ucbvax.Berkeley.EDU>
Source record: 223294

Having a hrrible paranoia about mixing libs and such (I was one of the Sozobon 1.33i beta testers who got bitten by such a problem), I decided that I wouldn't use the termcap library in MNTLIB19, opting rather to recompile from the sources.

Well, when I tried to run the stuff through GCC 2.1, I would get the error addbytes.c (22): Format bad in precompiled file.

Well, it's trying to read in "curses.ext". I looked at the file in question, and it doesn't seem to be corrupted or anything. Just straight text.

Any ideas?

Mike.

I tried using Elvis (as found on atari.archive.umich.edu) with Gulam, and the shell escape seems to have some bug, or perhaps it's Gulam, or... If I'm editing a file, and then switch to some other file using ':ed!', and then try to execute a shell command using ':!', I get kicked out of Elvis with three bombs. Anyone else experienced the problem?

3967. Hard Drives For Sale

Newsgroup: comp.sys.atari.st
Date: 1992-04-20 02:34:02 UTC
From: aq115@cleveland.Freenet.Edu
Message-ID: <1992Apr20.023402.20563@usenet.ins.cwru.edu>
Source record: 223297

* Hard Disk Drives For Sale *

I will sell this as a complete package, or as separate items,
provided I have parties committed to all parts before separating them.

Package Deal:

* Seagate ST-296N 5-1/4" SCSI 80 meg hard drive
* Quantum PRO40S 3-1/2" SCSI 40 meg hard drive
* ICD Host Adapter (with clock)
* Shoebox case with 65 watt power supply

$450.00 OBO

Separate:

* Seagate ST-296N: $175.00
* Quantum PRO40S: $150.00
* ICD Host & Case: $125.00

Prices are somewhat negotiable, and do not include shipping and
insurance. All parts are in excellent working condition. Both
drives are about two years old, and have less than 6000 hours on
them. The Seagate has a 70,000 hour MTBF rating (meantime between
failures) and the Quantum has (I think) a 50,000 hour MTBF rating.
Both drives have an advertised seek rate of 28 ms.

If interested, for best results, call me voice at 804-971-6919,
before 11 pm EDT. If I'm not around, please leave a message on my
answering machine with your phone number, and I'll get back to you as
soon as I can.

I'm selling these drives because they're external, and I want to put
a larger, single drive in my Mega STE, which currently has no
internal drive.

3969. Info on Sozobon C

Newsgroup: comp.sys.atari.st
Date: 1992-04-20 06:17:57 UTC
From: ehohnbau@Bonnie.ICS.UCI.EDU
Message-ID: <9204192317.aa21411@Bonnie.ics.uci.edu>
Source record: 223299

Could someone email me about the Sozobon C package.
I'm interested in details such as:

Can it be run from Gem
Is in ANSI compatible
does it have a debugger (is it visual?)
which files are needed from atari.archive and can they
reasonably be run from two floppy drives.
Is 1 Meg of memory enough to run it?
Are the docs any good?

> Is 1 Meg of memory enough to run it?
> Are the docs any good?
I know you asked for an email reply, but I'm posting this publicly,
since others may want the answers to, and also to announce that I'm
now on the internet, and can take Sozobon bug reports at the address
in this message's header.

First, there are two kinds of Sozobon C. One is from the Sozobon crew,
and the other is my modified version of it. The official Sozobon version
is v2.0; my version is marked as v1.33i. The Sozobon folks have c
concentrated on compiler internals -- making it portable to unix, for
example. I don't care about that stuff, so I've concentrated on making
it user-friendly for folks running TOS/GEM.

Can it be run from GEM? v1.33i is specifically designed to be friendly
both to shell users and GEM desktop (or NeoDesk or whatever) users.

Is it ANSI compatible? Nope. Neither v2.0 nor v1.33i is ANSI. But,
v1.33i has some common extensions such as concatenation of adjacent
string literals. Neither version can handle function prototypes.

Does it have a debugger? There is a separate symbolic debbuger that
works with both versions. (I don't use it, the name escapes me.)

Which files are needed? For my version, there is a single file,
SOZC133I.LZH, which contains **everything** you need to install and
run the compiler, except an editor and a debugger if you want one. That
includes GEM programming support.

Is 1 meg enough to run it? I run it in about 300k of free RAM.

Can it run from two floppies? Yep. A big ramdisk helps with performance.

Are the docs any good? So-so. My version is self-installing and
configuring, so you don't need as much help from the docs.

3971. Re: Incompatibility of MiNT_.94 and the POMPEY PACKER

Newsgroup: comp.sys.atari.st
Date: 1992-04-20 07:53:14 UTC
From: bammi@acae127.cadence.com
Message-ID: <BAMMI.92May2153714@acae127.cadence.com>
Source record: 223151

This is a common problem with packers: when they unpack and launch
the application they dont do so properly: The proper rule from atari
is:

```
/*
* From: kbad@atari.UUCP (Ken Badertscher)
* Newsgroups: comp.sys.atari.st
* Subject: Am I a DA? (long)
* .....
* I mentioned before that a DA's registers are garbage on startup, well,
* that's not entirely true. When the DA gets control, register A0 always
* points to its basepage. When a program is started by a GEMDOS Pexec(),
* register A0 is always cleared. Using this fact, it is possible to
* implement startup code which gets the basepage address from register A0
* if the code is launched as a DA, or at 4(sp) if the code is launched by
* Pexec(). Since it knows how it was launched, it can also do the stack
* setup required of a DA, otherwise it can use the stack pointer it gets.
*
*/
```

The GCC startup code (both MiNT/TOS libs) look for these conditions,
and decide if you are launching a DA or an application. If A0 is not
clear, it concludes that its a DA and sets up the stack+heap
differently, from what it does for an application, and hence they
fail.

The correct solution is to fix the packer. i had hacked up the gcc
startup code at one time to accomodate packers (by looking at sp@),
but got fried by people for doing that!

LZH201E is way out of date, the latest that I have sean is LZH201K,
but that is still a German version, the only English one that I have
seen is LZH201H...

3973. VCR to 1224?

Newsgroup: comp.sys.atari.st
Date: 1992-04-20 08:33:32 UTC
From: "J.J. Lehett" <JJL101@psuvm.psu.edu>
Message-ID: <92111.043332JJL101@psuvm.psu.edu>
Source record: 223153

What all is needed to use my 1224 as a 'TV' for a VCR? (If this is
at all possible, anyways.) Just to find out what would happen I connected
the RCA jack audio and video out of the VCR to my Monitor Master switchbox
RCA jacks. I assumed these were out jacks only, but amazingly enough the
audio of the VCR did indeed come through the SC1224. So anyways, what , if any
thing would I need to do to possibly watch the VCR on the 1224? Just a
novelty I guess, but I'd still like to see what its like.

>};

From the press release:

Gribnif Software is proud to announce the availability of Application
Systems Heidelberg's Pure C in the North American Atari market...
While the package remains in its original German form, the entire
program's interface is in English.

-and-

o 3 manuals, 650 pages total

I assume this means 650 pages of German? English program, German
manual. Hmmm...is it time to learn German or look elsewhere?

3978. Funny error in MiNT 0.94/Gemini

Newsgroup: comp.sys.atari.st
Date: 1992-04-20 13:18:27 UTC
From: olaf@oski.toppoint.de
Message-ID: <920420959@oski.toppoint.de>
Source record: 223156

Recently I got a copy of MiNT 0.94 and installed it. I ran MiNT 0.92
before and never got any problems with my favourite Desktop 'Gemini'.
Now, I discovered a funny weird behaviour of Gemini:

Right after startup (I have Gemini installed as an 'auto-start'
application (TOS 1.4)) Ctrl+key combinations, which are menu
shortcuts in Gemini, aren't recognized. Instead Ctrl+C stops
Gemini (and GEM!) and causes a system breakdown. But if I
use an Alternate+Key combination (like alt+m for the console window
or alt+o for reordering icons) before pressing Ctrl+C the first
time in Gemini, everything starts to behave as usual (i.e., Ctrl+C
will close a window etc.) and stay there.

I tried to relate the problem to one of my auto-folder programs
but it seems to be in MiNT 0.94, i.e., the bug is still there
on a plain vanilla TOS 1.4 without any ACC's or enhancements
(besides MiNT). It does not matter, if I put an
INIT=C:\gem.prg
in mint.cnf or leave INIT alone or if the Minix FS driver is
running or not.

But everything is fine if I install Gemini as 'Normal' and
start it by hand after booting.

I cannot even imagine what is going wrong here. Any suggestions ?

As we are on the topic, may someone send my a copy of the bgacc.acc
source code, most actual version (i.e., the version which uses
windows). I have no access to Internet. I want to enhance its
use of fonts and maybe add a 0x4F6 feature to it.

Regards,

3981. Re: ADSPEED STE Reccomendations?

Newsgroup: comp.sys.atari.st
Date: 1992-04-20 14:17:28 UTC
From: aq115@cleveland.Freenet.Edu
Message-ID: <1992Apr20.141728.2429@usenet.ins.cwru.edu>
Source record: 223161

John:

Okay, you want to know why I hate ICD so much? Here goes:

I bought my AdSpeed late last year. When I installed it, I noticed immediate software incompatibility problems (I won't go into detail here because this message is going to be long enough as it is). I spoke with ICD on the phone, and they insisted they knew of no problems with the software I was having trouble with. "It works for us!" they said. "Send it back and we'll send you a new one."

Okay, I sent it back. A week later I called them to see when the replacement shipped. "Oh, the guy that handles that is on vacation. We'll call you back." I called a week later. Same thing happens. A week and a half later, one finally shows up. I installed it. A few things that didn't work before now work. But others still don't. At that time, I was going through a major location change, so I ignored it for a while. Once I was settled in, I again started to talk with ICD. The peole in the tech dept didn't appear to care one way or another about my problem. The guy I spoke with (I won'tmention any names) didn't write down and of my info the first two times through it. Finally, he asked me to explain it a THIRD time, so he could write it down. Keep in mind this is while I'm paying for the daytime long distance call.

I finally said enough is enough, and decided to be rid of the damn thing once and for all. I called ICD to arrange for a refund. They said okay. I called a week later to see when the check was mailed. (Do you see a pattern starting here?) "Oh, we can't give you a full refund -- only dealer cost." Okay, fine. I'll take a $60 loss. Two days later, I called to make sure the check had been mailed, because I had a Mega STE on order. "Oh, we can't give you dealer cost, our president says we can only give you used value, which is $134.00" Hold on a damn minute. So now I'm looking at 1/2 the price I originally paid? "Oh, well, we'll send you a new one and you can return it to your dealer." I called my dealer. The distributor he bought the stuff from is out of business, so he can't help me. I said just send me a new one and I'll sell it. I also paid them extra to send it UPS Blue Label. When it arrived, it was the wrong one. They sent me an AMIGA AdSpeed. I called, and they sent a new one out the next day UPS Red Label. I did manage to sell the unit (not the Amiga one -- that got sent back) to a guy on GEnie.

Now, after all that, would YOU ever want to deal with ICD again? I sure don't, and never will. That's also part of the reason

behind me selling my ICD host with the hard drive setup a few
message back. I want NOTHING to do with ICD ever again. The
ONLY ICD products I'll continue to own are the 8-bit ones,
like Basic XE, etc. Only because there's nothing better,
and it wasn't their product originally -- it was OSS's.

Well, Robert, from your post I'd say you certainly have/had a legit bitch against ICD. This is unusual, however, in that you are the first person that I know of who ever complained of any kind of support problems from ICD. In my experience, ICD has provided nothing but top notch service and support but, of course, I guess there are always exceptions. Let's hope this was just one.

With your OK, I'd like to foward your complaint on to Nathan Potechin of ICD for his consideration. Yeh, it's likely too late to do anything about it but hey, "it couldn hoit!"

Source record: 223163

I'd like to hear if it's possible to use the SC 1224 monitor as a video (i.e. TV/VCR) screen as well. What would this take?

Currently, I have an SC 1224 and a 12" black and white TV, and I'm planning to buy a multisync monitor so I can run WP stuff in high-res mono.

If I could recycle the SC 1224 as a video monitor, I'd save myself the cost of buying a new TV. I can't take black and white any more, except for old movies...

I wonder how good the picture quality would/could be.

> includes GEM programming support.

On atari.archive.umich.edu, the filename is sozo133i.zoo. It's packed
with ZOO 2.1. If you have FTP capability, log in as ``anonymous,''
use your name@domain.address as a password, cd to atari/programming,
set type BINARY, and get sozo133i.zoo. If you have no FTP capability,
you can get the archive by sending the following in an email message
to atari@atari.archive.umich.edu:

send programming/sozo133i.zoo

The file should arrive in within 24 hours. If you do not have a mapped
UUCP or domain address, you may attach a ``path'' directive before the
``send'' command. It might look something like this:

path plains.nodak.edu!sodbuster!dirtfloor!hovel!yourname

From: Mark Choi <mc4c+@andrew.cmu.edu>
Message-ID: <MdwlE__00VIB0VWl1t@andrew.cmu.edu>
Source record: 223168

No, true color can NOT mean that. Although this is how one would
implement any sane true-color system. True colour is 24 bit graphics.
Period. As someone who works in the computer graphics\photorealism
field, I have to deal with this all the time. If your def. of true color
were the case, quite a large number of mono implementations would be
true-color.

3989. STILL for sale...WITH price cut...Atari 1040STe system

Newsgroup: comp.sys.atari.st
Date: 1992-04-20 19:03:26 UTC
From: adhir@cygnus.umd.edu
Message-ID: <12705@umd5.umd.edu>
Source record: 223169

```
================================================================
| FOR SALE - FOR SALE - FOR SALE - FOR SALE - FOR SALE - FOR SALE |
================================================================

- Atari 1040STe with 4mb ram (about 2 months old...)
Great home computer.
- 115 megs of HD space:
Seagate ST296N and Seagate ST138N w/ICD ADSCI+ Host Adapter
both mounted in a dual width, half height custom case (still
room for another 5 1/4" mechanism...I mounted the 138N behind
the 296 to leave room for a Syquest which I never ended up
buying)...powered by a 150watt XT power supply...
- SC1224 Color Monitor: 640x200 (Med and Low res)
- SM124 Mono Monitor: 640x400 (High res)
- Monitor Master switcher
- Spectre 128 w/Spectre v3.0 software
In case you don't know what this is, it's a Macintosh
emulator. Runs 20% faster than a Plus (actually it feels
more like a Mac II since the HD access is about 500% faster
and Macs rely heavily on disk access). 30 megs of HD are
dedicated to Spectre, with all the best Mac Apps running
flawlessly in Mac mode.
- LOTS AND LOTS of software...installed on the HD and on about
200 disks. Great apps (current versions) and great games (new
and old).

I am selling because I have to convert over to the PC platform due to
the nature of my job. I'll be sad to see it go.

Everything above for $1200 + COD charges (negotiable)
-----

*** Reduced to $1000. I am taking a loss here, folks.

>I spoke with ICD on the phone, and they insisted they knew of
>no problems with the software I was having trouble with. "It works
>for us!" they said. "Send it back and we'll send you a new one."

That's too bad. I used one for a LONG time (got it right after it came out),
and I never had any incompatibilities at all. I even hooked up the switch and
ran games at 16mhz with the cache on, and all of them worked (even Dungeon
Master). I don't know what you were running, but you are absolutely the FIRST
person I've ever heard of that had incompatibilities with AdSpeed!

>Now, after all that, would YOU ever want to deal with ICD again?
>I sure don't, and never will. That's also part of the reason
>behind me selling my ICD host with the hard drive setup a few

>ONLY ICD products I'll continue to own are the 8-bit ones,
>like Basic XE, etc. Only because there's nothing better,
>and it wasn't their product originally -- it was OSS's.

That sounds like a run of bad luck... I was never anything less than completly
satisfied with ICD. They were helpful and friendly on the phone...

I just sent three children's games to atari.archive. They are kidmixup.zoo, kidsong1.zoo and potato.zoo. These are all good quality games by D.A. Brumleve. If anyone else has any children's software that is pd/shareware please upload them to atari.archive. Others have notified me that they also have an interest in this kind of software so if you have some please share it with us.

Thanks,
Randy Hosler randyh@hpsad.sad.hp.com

One set of ports will do the trick. Use the THRU port on the K1 and set the two machines to different global MIDI channels, and voila, you should be in business. (Right now, I've got 3 Korg M1's hooked into an ST with only one MIDI port on it. All systems go.)

>novelty I guess, but I'd still like to see what its like.
>------------------
Your audio out is just connected to both the RCA jack and the DIN plug
so it was just fed thru. On the video side your monitor takes RG&B signals
plus horiz. and vert. sync. No go unless you have a circuit to convert
composite (from VCR) to these.

>write the bootsector)...

My original point was that a normal Atari disk (one formatted using the
operating system's standard format routine) can be "converted" to an MS-DOS
readable disk after you've already written stuff on it. The average user
is not aware of this, and no software is advertised as having this (useful)
capability.

I very much doubt that a DRIVEPARM option or any other adjustment would
allow MS-DOS to read a 10-sector-per track Atari disk. If so, someone
would probably have used this (or some variant) in a disk copy-protection
scheme. But none of the MS-DOS software that tries to defeat copy-protection
even considers an unauthorized number of sectors per track.

Doug

4005. Need chess players to test GRAPHICAL GNUCHESS port

Newsgroup: comp.sys.atari.st
Date: 1992-04-21 03:41:07 UTC
From: warwick@cs.uq.oz.au
Message-ID: <7584@uqcspe.cs.uq.oz.au>
Source record: 223185

Hi,

I'm looking for people who can play chess to test my GRAPHICAL port
of GNUChess 3.1.

It supports these features of GNUChess:

quit load save edit level switch rotate undo both remove new

ie. You can play chess against the computer.

Trouble is, I'm not much of a chess player (I wrote did this port
as a test of my graphical class library).

Anyone with a colour monitor (sorry, my graphical library is
a bit lacking on monochrome support) is very welcome to bash
away at it. It may not work with 512K - I might need to
severely restrict it (eg. cut the hashtable WAY down).

I'll be releasing all the source code (to chess and my library) as
soon as I iron out any bugs in this port.

If there are enough testers, I'll ftp (tell me where if a.a not okay),
else I'll mail it.

--
Warwick
ps. If you use G++ and would like the source now, that's fine, so
long as you don't want to spread it around yet.
pps. Sorry TT owners, it's a STLow rez game, so it'll probably gross
you out until I get around to supporting TTMedium.

>
> Actually, the CD-ROM drive made by Atari is supposed to be compatible
>with IBM and Mac CD-ROM formats so you should have a good base to work from.

No "supposed" about it. All CD-ROM drives support the same "format", so
any CD-ROM drive can read any CD-ROM disc. So the Atari CD-ROM drive is
"compatible" with IBM and Mac CD-ROM discs.

Now, that just means that the Atari CD-ROM drive can read individual sectors
from any CD-ROM disc. Whether or not TOS can interpret those sectors as
files and directories depends on the volume structure used on the CD-ROM.

My understanding is that Atari MetaDOS allows TOS to interpret files and
directories stored using the ISO-9660 and High Sierra volume structures. Since
almost every DOS CD-ROM uses either the ISO or High Sierra volume structure,
you should be able to read the directories and files of any CD-ROM intended
for DOS.

CD-ROMs for the Macintosh may use ISO or High Sierra, or they may use the
HFS volume structure (the same volume structure used on Macintosh hard disks).
MetaDOS will read the ISO or High Sierra Mac discs fine, but can't interpret
the directory tree of an HFS disc. You can still do raw sector reads of an
HFS disc, but you won't be able to interpret those sectors as directories
or files.

4012. Info needed: [Enhanced] ST BASIC and GFA BASIC (long)

Newsgroup: comp.sys.atari.st
Date: 1992-04-21 05:46:24 UTC
From: kllove@uokmax.ecn.uoknor.edu
Message-ID: <1992Apr21.054624.9138@uokmax.ecn.uoknor.edu>
Source record: 223192

Is this the right group to post this to? If not, please direct me toward the right one. Regardless, send replies by e-mail. I'd hate to miss a good reply just because I don't have the time to read this group on a regular basis!

Okay, I have the original ST BASIC and the enhanced version (w/ a LOUSY manual). I also have a commercial game (Bridge 4.0 by Artworx) that runs fine under the original BASIC, but won't work under Enhanced. BTW, are there any other versions out there? I got the Enhanced version with my Mega 2 about 4 years ago.

Among other things, it PEEKS(1099) which I deducted was the screen rez. (1, 2, and 3 imply Low, Med, and High, respectively.) Enhanced ST BASIC (hereafter, ESTB) gives me an illegal function call and stops running the program. How do I check screen resolution in ESTB? How would I select the correct rez? Is there a way to store which resolution the program was booted in (along with screen colors and other things someone may want to be the same after the program exits) and then restore the ST to this (these) setting(s) upon program exit? Are there any good books explaining things like this?

Also, this program uses: GB, CONTRL, GINTIN, etc. The manual for ESTB does not make clear how to use GEM_INTIN, etc. to replace the old syntax. Neither manual explains AES, GEMSYS, or any thing like it (that I've found anyway!). Anybody got a GOOD source for this info especially if it's related to ST BASIC and it's particular syntax? (Would this sort of info be in the developer's docs? See my previous message. RE: 'How to become an Atari developer?')

I'm trying to make the program more structured, but it's not easy. Does anybody know of an algorithm for doing this? I've been trying to figure out one, but it's not coming to me. It should be general enough to write a program converting "spaghetti code" to structured code. (All right! Stop laughing. It *IS* possible to right BASIC code that does NOT use a single GOTO!) I'd just rewrite the whole program in C or Pascal, but why re-invent the wheel? Besides, I've already learned some things I didn't know and it's fun to disect all the code and rewrite it to be more readable. BTW, is it legal for me to do this restructuring?

I have GFA BASIC 3.0 (or was it 2.5? hmmm, I guess I should check on that. I purchased it about the time it switched hands, anybody know which version I've got based on this info? The manual doesn't have the lion on it if that helps. Which company had the lion and which company has GFA now?), but I have never received any upgrade notices, or anything at all for that matter, from the company. I'm not sure which company I

sent my warranty card to (it's been a long time). I know that I just sent in the postcard that came with the package. Am I the only one with this problem? Who owns the program now? What's their address? Upgrade policy? Oh yeah, I don't have a compiler for GFA, does anybody know if my version has one available?

Has anybody got a program to convert ST BASIC programs to GFA? Will I have to do it by hand? Is it legal to do this? (NOTE: I've asked this before, but got nothing definite except to write the company and ask. However, I've lost Artworx's address/number. Anybody have it handy?)

Sorry for the length of this post, but I have a lot of questions!

Date: 1992-04-21 06:07:33 UTC
From: cs64scm@sdcc8.ucsd.edu
Message-ID: <31877@sdcc12.ucsd.edu>
Source record: 223194

I've download the "HERM100B.LZH" file from a.a, nic.funet.fi, and a couple of other places, and all give me a CRC error when I'm uncompressing, right inside of WHOAMI.TTP... Since four different copies can't ALL be bad (unless... :-(, I think I have an incompatible LHarc. I'm using Quester 2.01i. Is this the proper model to be using?

>> at around the same price as the Gemulator, you'll require even more
>> money to buy RAM and a Monitor for it.
>>
>
>Ok Price for GEMulator so far has been at $300 - $500.

Not necessarily, Darek is considering prices in ranges of $99.00 - $250.00,
still undecided in mail I received from him
He said anything over $250.00 will be after it's initial release. It's like
when PC-Ditto II came out, to register people, it was $150.00, but to retail
it was $300.00 new.

>TOS Roms Figure $50
>Lowest price possible $350

With lowest possible up to Darek would be $149.00

>
>For $350 I can find you a 1040ST w/2 MB, Mono monitor and a massive
>library of software. Look in the Recycler.

Again used, and only ST, not STE

>
>Hard Drive? Add $400 for a nice 80MB. $750 will get you a great system

Add $400 then, then add $200.00 for upgrade on 1.44Mb floppy and then add
AT speed, and then a hi rez card and then a co-processor and then....

>
>For a PC? You will need to spend $2500 to get anywhere's near the point
>of GEMulator being valid. SVGA, Enough MB to run Windows effectively, a
>SB-PRO, Nice monitor... No hardware support...

>
>Can you plug in a cart into the GEMulator? IE, CLAB's UNITOR?
>

I added figures before and nowhere near what you said to be true,
486-33DX with SB Pro, 4 megs, both high density floppies, 130 meg HD,
gemulator with ROMS, mouse etc... comes only to about $2100.00 at most!
And pay close attention: It's not ST emulation only, it's closer to
a STE 2 meg emulation with both monitors and
etc...

4016. Computer GO

Newsgroup: comp.sys.atari.st
Date: 1992-04-21 06:14:39 UTC
From: kllove@uokmax.ecn.uoknor.edu
Message-ID: <1992Apr21.061439.29214@uokmax.ecn.uoknor.edu>
Source record: 223196

As in my previous messages, I'm looking for e-mail replies only!

I'm looking for a computerized version of GO for Ataris. I have GNUGO and something else that has no computer player, but I'm looking for something better. If the manual included a short description of the rules and terminology of the game, then all the better.

(I definitely do not want GOMOKU, so don't even mention it!)

I've heard that a program called 'GO Nemesis' (or was it 'Master'?) was available somewhere in Europe, but I don't know how to go about finding it (it's old). My local 'Software City' cannot seem to get ST software that I want. (It took 3 weeks for them to find LDW Power for goodness sakes!) Anybody have any information on this game?

Am I going to be reduced to buying and running 'GO Master' under PC Ditto I? It seems to me that this game should be widely available. It is one of the most popular board games in the world, right?

Its not worth running on anything in the PC class except on a Mac.

Not only that, but the St version is in badly need of an update.

>
>-- Scott Willingham

I'm ashamed to admit it, but I think BobR is right, in his own rather brusque way. Although grey is a valid color to wish to render, in choosing to render ONLY grey, you are throwing out (8**X-2**X) colors where X is the number of bits per gun (as RGB must all be equal to have levels of grey). So if you have 24-bit COLOUR video you can have 256 levels of grey (as each colour has 8bits), but if you have TOTAL 256 colours, you cannot do this. And in fact, if you did have 256 unique levels of grey, you probably could make it "True color" in that it would be indistinguishable from a black&white photograph, but certainly distinguishable from a color photograph, let alone what you see with your eyeballs.

I thought that the Megatalk only provides a RS-422 port (for appletalk).
Does it also have a SCSI port on it as well?

Hopefully Dave Small will fix Spectre to support the normal SCSI port
so that point will be moot for TT owners...

Message-ID: <1992Apr21.075816.13796@daimi.aau.dk>
Source record: 223200

Well, it does seem that I have forgot to put in atari.el in the distribution, which off course is a serious mistake. I can't really check it, since the files seems to have vanished from atari.archive. As a last chance, perhaps it ended up in the lisp/term directory.

I really thought that I had been carefull when putting the stuff together :-)

>
>o 3 manuals, 650 pages total

> I assume this means 650 pages of German? English program, German
>manual. Hmmm...is it time to learn German or look elsewhere?

Don't let german manuals deter you: the version I have has
english menus and error messages, and german manuals and online help.
The announcement *may* mean that now the online help is also in english.

Most of the manuals and online help is standard somehow and is therefore
also described in english documentation:

- ANSI C and the ANSI standard libraries are described in K&R 2 and similar
books.

- VDI, AES, XBIOS, BIOS, GEMDOS, and LINE A are described in other
documentation (if nothing else, the now easily available developer docs
describe them).

- The most frequently used compiler options can be set
online using english texts.

- The BGI (Borland Graphics Interface) library is probably described in
many PC books; I have never used it.

For the remaining parts some guessing is required, and perhaps a dictionary.
For me, those 650 pages of documentation have seen perhaps 1 hour usage....
Although I have been taught German at school, I have never been any good
at it, but the language has never been an obstacle when using Pure C.

In short: I can recommend Pure C, also to non-germans.

And yes, the only connection I have with the authors of Pure C is
that I've bought the program.

No, I've got past the fires beyond the hill section. You go to the top
right part of the hill and it takes 2 rattles to kill the thundercloud.
Then you jump on the jack-in-the-box and when it goes off jump up onto the
cloud. then jump up to the top of the hill and get the things there, jump
back on the cloud, and then stay on it as it drifts to the right. There
you should find a small cloud with a life on it. You should be able to
jump down beyond the fires.

MC> were the case, quite a large number of mono implementations would be
MC> true-color.

Ok, apparently people are using different definitions of "True Colo(u)r".
Is there an ISO standard for this term? :=)

Back to the Falcon. What Leonard Tramiel said of the Falcon was:
1. It would have no palette (he called this "true color" - whether this was
the correct term or not has been discussed enough in this group I think)
2. He would not confirm or deny that this would be 24-bit graphics.

Now I wonder what will be the compatibility of the Falcon with previous ST
models. If the Falcon is going to run existing ST software (e.g. painting
programs) it must have some way to emulate the low and medium res, and
these use color palettes. I would think that the graphics should have a
true color mode AND the traditional modes with palettes, wouldn't you?

By the way, if the Falcon will really be what has been revealed so far I
want to have one.

24 bit color (8 x 3) means about 16.7 milj. colors and humand eye can
separate about 6 million different colors and even that is archived
by comparing colors that are very close to each other.

My GCC 2.1 works fine with an older version of gcc-as, but it doesn't
seem to be your problem.
As I could read in your article, the gcc-as stops after beginning its
work. Or is it the linker?
Did gcc-as open the .o output file ? Have you set the environment
TEMP or TMP for gnu outputs?

At first try gcc with the -v option to see when gcc-as opens any ouput
file. Then try gcc with '-v -c' to get a .o file. If this doesn't work,
look at your acc's and auto folder prg's.

My gcc didn't work with harlekin, so I removed it. ap.

Hi zak & everybody else,

I will try to compile it with TurboC 2.0 soon.
If it comes out working, i'll upload it to a.a later

Btw : didn't anybody think of using TC before ? In other words : what is
so great about compiling with GCC ? I made Jpeg2.0 work with TC, and
it is about 30% faster than the version available at a.a that is compiled
with gcc 1.4

read u later,

Yeah, I'm a bit worried about this no-palette stuff. How are you supposed to do vertical twisting scrollers based on hbl palette-flicks if there's no palette??! (e.g. Digital Insanity #1 screen on TLB-Mindbomb megademo). I know there's no chance you can have 256 palette registers on a shifter chip without going to some sort of internal ram, but wouldn't a better solution be to make say the bottom 16 colours go through palette registers? I've also programmed Acorn Archimedes. It's 256 colour mode was a *real* mess. The colour you see was made up from several bits of the actual colour value plus several bits from 1 of 16 palette registers. The result was that many of the 4096 colours were only available from 16-colour (or less) modes. Why don't these computer manufacturers think before they make thousands of people suffer for 5 years?!!

>the fly, just like AdSpeed. So do the T20 and T25. I verified
>this through Jim Allen of Fast Tech.

The T16 supports the 8 Mhz speed but it is not "true" (i.e., meaning fully Atari ST compatible) 8 Mhz. The can be verified by the fact that one cannot display Spectrum pictures on a T16. One can do so on an AdSpeed, which is why I bought mine. :-)

The caveat to the above: This was true when the T16 was introduced. If there have been design changes since then, the T16 may now have a "true" 8 Mhz mode (however, I don't think so :-). Again, Spectrum is the test - ask Jim Allen if the T16 can display Spectrum pictures in the 8 Mhz mode.

Cross-posted to: rec.music.synth,comp.sys.atari.st,misc.forsale

Sorry for the reposting. I keep putting these up, someone commits to
buying them, then backs out...

I have the following Atari MIDI software forsale:

Passport Master Trax Pro (v3.6)
MIDIMouse UltraMIDI total control Workstation
Michtron Super Conductor

I would like to get either $100 each for the first two (Michtron thrown
in to first reply free) or I will sell them all for $150. I want to
get some money so that I can upgrade to Notator by C-Lab.

swood

Ah, the innocence of youth... The TI 99/4A was a Texas Instruments home computer, powered by an 8-bit Motoroloa 6502, and was in the same genre as the Atari 400/800, Commodore 64 and Apple II. The little unit had some tremendous color and sound capabilities, built up quite a user following, and was then orphaned by TI. The lesson to be learned here is that even if the maker of your computer goes belly up (as has been predicted by the doom sayers about Atari for ages now <snicker>), you can _still_ enjoy it!

My roomates Zenith could even read my TOS 1.0 formatted disks at 10
sectors a track, without me putting a boot sector on it. It was pretty
uncanny. I think there was a problem in the BIOS of some machines to
read 10 sector disks, but I have seen programs for MS-DOS that will
allow more sectors poer track. (The same roomate found one that allowed
1.6 megs on a 3.5 HD disk)

Unfortunately, he upgraded to DR DOS 6.0, and it won't read
extended formatted disks.

I've never owned one, but a friend of mine did. It was an 8-bit computer made by Texas Instruments. Pretty nice machine really, with the built-in sprites. (Awww, the good old days. This was when I had a Radio Shack Color Computer, with extended basic and 16k, and a tape drive.)

I think the Atari 8-bits were better though! :-)

4040. Re: Info needed: [Enhanced] ST BASIC and GFA B

Newsgroup: comp.sys.atari.st
Date: 1992-04-21 15:03:44 UTC
From: hutch@bellman.lanl.gov
Message-ID: <1992Apr21.150344.7272@newshost.lanl.gov>
Source record: 223320

Kenneth, rather than hit all your questions about ST BASIC, I'll give you the best bit of advice up front... FORMAT your ST BASIC disk! At least then, it will be worth something. :) Seriously, ST BASIC (Enhanced or otherwise) is garbage, pure and simple, with my unabashed apologies and sympathies to the original developers of this extremely sorry language. If you want to program in BASIC, then use the latest version of GFA BASIC. Quite simply, there is _no_ other valid choice for serious program development in BASIC on the ST! (arguments to the contrary are invited via email, those who dare). :)

Yes, it _is_ possible to right structured code in BASIC, all you need are the right tools. Your copy of GFA may have been purchased from Antic back when Michtron got p-o'd at GFA and dropped them. To find out what version of GFA you have, enter the command PRINT ERROR 100. You'll get a copyright notice and the version number. If you have anything less than version 3.5, you should upgrade by contacting the US distributor GFA Software Technologies, at 1-800-766-6GFA, in Salem, Mass. Upgrade costs are cheap so check it out. Make sure you get the complete upgrade with new manual and compiler, though.

There have been some PD programs to convert ST BASIC to GFA but they all had one little problem... they didn't work. Well, not very well, anyhow. Sure, it's legal to do whatever you want with public domain code, just don't claim it as yours. If you are mucking around with commercial code, you can still do whatever you want as long as you don't distribute copies of it.

Send email direct if you (or anyone else) has specific GFA questions.

>am I considering getting a drum machine for obvious reasons. Can I drive
>both machines from my ST? Would I need another set of MIDI ports, or
>could I just go thru the THRU port of the K1?

I'm not familiar with the Kawai K1-II, but most MIDI thru ports transmit exactly what was received in the MIDI in port. You will be able to send MIDI data to your drum machine by connecting it's MIDI in port to the Kawai's MIDI thru port...BUT...you won't be able to transmit data back from the drum machine to your ST unless you use a device to merge the output of the Kawai and the drum machine back into the ST's MIDI in port. If you were intending to do patch editing on both, you'll have to ensure that you have two way communication with both. This means that you'll have to swap cables each time you want to edit the other device unless you have a merge device or MIDI patch bay. If all you want to do is play the sounds in the drum machine via the ST, the thru setup should work fine.

If you plan to continue to expand your MIDI system, I'd seriously consider budgeting for a MIDI patch bay.

> <X>

And probably incorrect. Every time I've seen such claims, it has turned
out that the C benchmark code was broken.

The last time I looked into such a case, it involved a C program that took
4 minutes to run. After minor repairs, I had the program executing in a
few seconds.

The program found prime numbers by employing a test that required several
unnecessary layers of floating-point arithmetic, each of which introduced
significant function-call overhead. All that was needed was the C modulo
operator (%).

>true-color.
>
>
>mark

Okay, your right. THE meaning of the true-color buzzword as used in mainstream computer graphics DOES MEAN 24 bits.<-That's a period. I admit, I was mainly trying to generate controversy (hey, I did it!). BUT when I asked other computer graphics professionals "who work[s] in the computer graphics\photo-realism field", like you and myself, "what does `true-color' mean?" they reply: "As opposed to...?" As in "as opposed to pseudo-color". As opposed to pseudo-color, my definition CAN be correct. Of course, as opposed to nothing, simply as a buzzword (a marketing buzzword, IMHO), it means 24bits, 8bits each channel.

The main point of this post is: You are correct, I was wrong. Now, how often do you see that anywhere on the net? I guess if you really feel the need, you can come back and say "No, your not even partly correct - PERIOD", but why bother? :-)

Regards,
Doug

4049. Sozobon MiNT library version 19

Newsgroup: comp.sys.atari.st
Date: 1992-04-21 17:47:16 UTC
From: bigham@hercules.acpub.duke.edu
Message-ID: <2527@news.duke.edu>
Source record: 223329
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

As promised, I have placed a compiled version of the MiNT library for Sozobon C at atari.archive; it should be migrating to atari/mint shortly. It consists of a replacement dlibs.a and dstart.o, a termcap library, and a replacement set of floating point printf/scanf routines. I've also included some (very small) source changes and some advice for those who are interested in building this puppy themselves.

If you have problems, send them to me, and I'll forward them if necessary (I don't _think_ i made enough changes to introduce any bugs, but you never know...). My plans for the near future involve adding lmalloc() routines and rearranging the library so it doesn't drag in so much junk by default, so watch this space for new releases.

> Truecolor vs palettized color

There's absolutely no reason that truecolor modes (15/16, 24, or 32 bit) and palettized modes can't coexist in the same graphics controller. In fact, every truecolor card I've worked with in the MSDOS world also has palette-mapped modes available.

4054. Sozobon v1.33i - fixed MINSTART.S acc startup source

Newsgroup: comp.sys.atari.st
Date: 1992-04-21 19:31:20 UTC
From: ilepore@isis.cs.du.edu
Message-ID: <1992Apr21.193120.2993@mnemosyne.cs.du.edu>
Source record: 223334

Some asked for the runtime startup module for a DA using Sozobon and GemFast. Steve Yelvington mentioned the sozc133i.zoo file, but it contains a broken MINSTART.O module. Here's the source for minstart.s that works. Use JAS to assemble this.

```
;************************************************************************
;
; minstart.s MINI-APPLICATION STARTUP PROGRAM
;
; This version contains ONLY what is necessary to start a C program up;
; C runtime support has been trashed (don't try to use printf, et al).
; This startup lets you write a program that can run as both an acc and
; a prg just by renaming it. Test the variable '_accstart' in your C
; code at runtime, if non-zero, you're running as an acc.
;
; The stacksize in this startup file is fixed at 4k. You can't change it
; other than by tweaking the constant below and re-assembling the file.
; If anybody knows of a way to do dynamically-sized stacks at runtime in
; an ACC, please let me know.
;
; 08/12/89 - Added _accflag & code to make this startup file support ACCs.
; 08/26/91 - Modified .ACC detection per Ken Badertscher's info. Now the
; a0 reg at entry is used for detection: non-zero == ACC.
; 09/23/91 - Fixed glitch that was leaving stack pointer in high memory
; after we gave up that memory to DOS, when running as PRG.
; Also, added __base and __envp, so that programs could access
; env data and command line args, concepts which are useful
; only when running as a PRG, of course.
; 04/20/92 - Nice little bit of cleanup. Increased stack from 2k to 4k;
; the new GemFast is a bit more demanding on stack space.
; Added _argv, _argc, and __exit. Nuked stack cookie junk,
; since this is *minstart*, and that was a one-shot debugging
; thing for Bob Goff. When running as a prg, now uses local
; stack instead of allocating another stack (wasting 4k).
; Removed pc-relative accesses in gemdos et. al. that were
; preventing the use of JAS to assemble this file.

> 99/4A?

It was the first 16-bit home computer, made by Texas Instruments before they pulled out of the computer market.

It had a 16-bit processor, but very little memory (I forget exactly how much) and a pretty poor version of BASIC. It used to do a pre-scan of BASIC programs before running them (a lengthy wait) and it ran them excruciatingly slowly.

You had to buy a ridiculously expensive disk system before you could do any machine code work on it (no PEEK or POKE in the BASIC). Someone had a look at why the BASIC interpreter was so damned slow and discovered that the interpreter program itself was being interpreted by some other code.

Redeeming features included the terrific speech synthesiser add-on, and some of the games were terrific. I've yet to see anything that rivalled Parsec, a sideways scrolling shoot-em-up that was light years ahead of later stuff.

It also had good implementations of the Scott Adams Adventures, with full graphics, and a great version of Atari Pole Position.

Anyone else who remembers it, please correct me if I've got anything wrong.

NO!!!! The TI 99/4A was based on their own 9900 cpu making it the first
16 bit home computer.

4058. Re: Info needed: [Enhanced] ST BASIC and GFA BASIC (long)

The format your language disk was a laugh! True, but still funny. I just thought I'd add that I've tried HiSoft Basic Pro that I picked up for $30, I guess they may be dropping support too. I'm pretty much satisfied with the package since it has a nice editor & compiler. It attempts to be ST Basic, GW Basic, & Quick Basic compatable. It really produces bloated code, but of the IBM GW BASIC stuff I've compiled I've only got 4-8 syntax errors/prg. Usually it's just something like the GW PLAY that isn't supported. A few other oddball things like different screen sizes like 40X21 if you're using a window (I should say the program 'thinks' you're using a window). Anyway, if you find a cheap copy, I'd reccomend it as about 5-10X better then ST Basic.

4059. Can MS-DOS read extended format? (WAS formatting PC-readable disks)

Jody Lenn also sent in the following info:
"I format 82/10 with DC Format all the time and take them to school and
download stuff from the archive to them using a 386???
I have never got an error yet."

All I can say is that the IBM XT and AT computers I tried it on several
years ago refused to recognize 10-sector Atari disks. (I had a Word
Perfect disk whose directory got trashed, and at the time I couldn't
find any decent Atari data-recovery software, so I tried various MS-DOS
disk-tool programs.)

Perhaps some of the newer hardware behaves differently.

>computer, powered by an 8-bit Motoroloa 6502, and was in the same genre as
>the Atari 400/800, Commodore 64 and Apple II.
I cannot pass this one:-). This information is essentially incorrect.
Chip used inside of these computers was Texas Instrument 9900 and this
was true 16-bit chip in times when no other computer in personal class
was even looking beyond 8-bits. DIV instruction, for example, was
taking 32 bit number dividing it by 16 bit number
and returning 16 bit quotient and 16 bit remainder.
Sounds familiar? :-) It was also using 16 register file of general
registers (not hard but soft registers which could be positioned
anywhere in memory). Does not look very like 6502 or 80xx for that
matter.
It had a number of very interesting hardware solutions - years ahead
of competition - and also pretty "creative", ahem, marketing concepts.
B
Sometimes ones get an impression that quite a few of these marketing
guys later somewhat surfaced in Atari.

: Would a possible solution be to make sure that the disks being swapped
: have different serial numbers? I have seen utilities to give random
: serial numbers to a disk (I believe on the atari archive) or else in
: was in one of the commonly used formatters.

Disks normally have different serial numbers. When you format a disk
from the desktop, TOS generates a random 24 bit number to use as the
serial number. The chance of two disks ending up with the same serial
number when formatted this way is very small.

It is important to have different serial numbers, because that's how
TOS recognizes that a DIFFERENT DISK has been inserted into the drive.
But the original poster's problem is different. There, the SAME DISK
was being removed from computer 1, modified on computer 2, and then
returned to computer 1. The serial number was the same because the
disk was the same, and TOS has no idea that the disk was modified
while it was out of the computer. The solution, which I outlined in
my previous posting, is to put another disk in the drive (with a
different serial number) and force TOS to look at it before returning
the original disk.

Sorry, can someone succinctly explain why, if you've moved on to a PC, you would want to run ST software? Surely, for any function you need your software to perform, native MS-DOS software will perform it better than emulated ST software?

If you can't stand WINDOWS and simply *must* have the look of the ST desktop, then you can always get the PC version of GEM (of course you'd want to get the original version of the desktop, not the one that comes with GEM/3).

>or files.

If a HFS-format CD-ROM looks just like a big disk drive to the MAC, then
you might be able to read it with SPECTRE GCR. Perhaps you don't even need
MetaDOS in this case?

Also, how can one tell if a CD-ROM disc advertised for use on the MAC is in
ISO/High Sierra or HFS? Is the common format only used for text files, where
the same disc can be used on both MS-DOS and MAC platforms? Presumably any
disc containing graphics or other MAC-specific stuff would be in HFS, since
the same disc could never be used on a MS-DOS system.

Some one has there Facts wrong, the TI used the First 16 bit computer chip,
the TI 9900 series from memory, this chip was out when otheres were raving
about 8 bit chips, I know I have used these chips and a full TI computer
based one one...

From memory the CPU IC did not any built in registers they all in
Ram..!!

I found that you can't simply install the new archives from scratch. The problem had to do with a missing gcc-as.ttp (oops). Seems as if the -v option doesn't quite work for that. Does anyone know what I need to get the G++ portion working? I figure I need the original G++ include files, but should I use j. bammi's library files or the ones from the abaddon g++ compiler?

Dong.. you loose. The TI was actually one of the first 16 bit
home machines on the market (** NOT ** 8 bit.) I think it was a TI
processor, but I just cant remember. It was a pretty cool machine,
except for the lack of machine code access, and a few techincal booboos
that slowed the machine way down (down to 8 bit levels....). If anyone
really cares, Iwill ttry to find mine and look at what CPU it has.

Ziggy.

>of TeX on my 1MB, floopy STe. Is this possible, and if so is there
>a doc file of some sort that could tell me what i can/can't install.

Yes, it is possible. I had this running a couple of years ago as well.

No, you don't like working with such a setup.

No, you can't do big documents with such a setup. I had a 150k ramdisk
which carried my TeX source, my .aux, .log and .dvi files.
VERY restricted.

I think you can install 1) Tex 2) a previewer but metafont is IMHO out
of the question.

I don't have my setup available overhere. If you are really interested i can
dig up a floppy containing the setup (i think). No copy allowed --
copyrighted TeX version on it!

I just purchased the COMPUTE! tech ref guide volume 2, AES. I have
been looking for these books for a while, and I know that they are out of
print, so when I saw this one at a store, I snapped it up. What I want to
know is, does anyone know where I can get the other two books in the series,
particularly Vol. 1, the VDI? If it is absolutely impossible to buy them
anywhere, then does anyone have a copy that they would be willing to sell me?

Thanks,

Robert Morrison

From: fnjlh1@acad3.alaska.edu
Message-ID: <21APR92230224@acad3.alaska.edu>
Source record: 223205

A general (because I don't know enuff to be specific) question on our much beloved OS, in this case TOS 1.0 in a 1M ST:

When running a program from the desktop, does the program grab most of the remaining RAM? When I run FLASH or WordWriter, I get about 37548 of free RAM. When I run FirstWord (which expects to run its printer program later), I get about what I would expect from RAM - program size.

If I create a 500k RAM disk, then run FLASH, I still get the 37548 of remaining RAM, so it seems as if some programs grab most of whatever RAM is available. Is this correct? Why are they so greedy? Are they just programs of the Reagan years? Does your ST do this? Am I here all alone? Tired minds want to know! Thanks jharris/fairbanks

Even if the manuals are in german, the most important question is if the online help will be fully translated into english. I have worked for some time now woth the german version, and I hardly ever need the manuals - the online help is much better. It includes the complete library, all OS bindings (GEMDOS/BIOS/XBIOS/AES/VDI), all compiler, linker etc. options, a short C reference and some other things which I may have forgotten. You can even add your own context-sensitive help pages. So if all this is translated, you should have no problems using PureC even with german manuals.

No, they're not. It was probably cheap because HiSoft Basic V2 is now
available. It's a significant upgrade, with TT, '030, floating point copro
support and lots of other improvements. And it comes with a BASIC version of
Mon ST (source level debugger).

> I'm pretty much satisfied with the

Yeah, code size and speed is a problem. I don't know if V2 is any better.

Ever heard of the InterNet and ftp? I have 125 MB of disk attached to my Mac, mostly full, and with practically no commercial apps on it. There are a wealth of free or cheap shareware products for the Mac, and most are a lot more sophisticated and elegant than their DOS/Win3 counterparts. I imagine this is because Apple has put so much good stuff into the OS that writing such code is fairly easy.

4078. What is the latest version of Pure (Turbo) C.

Newsgroup: comp.sys.atari.st
Date: 1992-04-22 10:04:03 UTC
From: geert@ccsds.ahold.nl
Message-ID: <3282@ahds.ahold.nl>
Source record: 223208
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

While looking at the news, I saw some postings about Pure C
for the atari-st. I am a proud owner of Turbo C.
What is the version of Pure (Turbo) C now? The latest version
I know and have is 2.03, and was then named Turbo C.
If there exists a newer one, what are the enhancements made
to the 2.03 version, and how much is the update price.

Also, for those who are using the bgi interfaces of Turbo C2.03,
I have the following question.

Is it possible to combine bgi with gem? When I use the bgi interface,
the mouse pointer disappear. You can switch it back on. But I discovered
problems using a menubar or a form with bgi being actif.
Mostly the program crashed when I enabled something of GEM.
How is it possible to mix both gem and bgi? Hopely someone will help
me with this.

Thanks in advance.

4081. Mark William's C (old version) fseek() problem?

Newsgroup: comp.sys.atari.st
Date: 1992-04-22 13:45:24 UTC
From: CADS_COLE@GALLUA.BITNET
Message-ID: <1992Apr22.084524.1@gallua>
Source record: 223211
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Greetings from the void,

I've got an ancient (relativly speaking), ST with an equally ancient TOS and Mark Williams C. The copyright on the C book says 1986. Unfortunately, it's not mine, and it's the end of the semester, so I have neither the time nor the motivation to buy upgrades for it.

Now, the problem: Is there something wrong with the fseek()? Here's a fragment of a program that runs correctly on a VAX and an Amiga 3000 with Matt Dillon's DICE. The whole program is 319 lines long.

```
-----------

(void) fseek(fin,0L,2);
dumpsize = ftell(fin);
head = NULL;
if ((head = lcalloc(dumpsize,1L)) == NULL)
{
printf("The memory allocation failed... Aborting.\n");
exit();
}
(void) fseek(fin,0L,0);
(void) fread(head,dumpsize,1,fin);
fclose(fin);
printf("%ld bytes read from %s\n",dumpsize,fid);

-----------
```

This results in 3 bombs. Dropping some printf's in to see where things failed, it appears to happen just after the second fseek(), when it attempts the read. This suggests to me that the fseek(fin,0L,0) is not returning me to the start of the file, as it claims in the book. (I tried using SEEK_SET or was it SET_SEEK? In either the #define isn't there for this version of Mark Williams. It does exist for the VAX and the Amiga C's.)

> "compatible" with IBM and Mac CD-ROM discs.
>

To set the record straight.

A CD-ROM (the media) looks a lot like an Atari Hard Disk (in spirit!).
There is an initial information block at 0.
There ARE partitions. The information identifies their location and
type (music, data, or ??).

The current IBM format uses a single data partition. You can well expect
newer "multi-media" ones won't.

The MAC format uses multiple data partitions.

Music discs are one partition (all music).

The Atari CD-504 drive that I have will ONLY READ ONE PARTITION.
Further, it will only read as "data" sectors in a DATA partition.
Thus you cannot read a music disc as data -- you can only play it.
(This may be a copy protection scheme -- or just short sightedness).

Applications:

CD-ROM applications come in two flavors.
1. The CD-ROM is the DATA, the program is on a floppy.
This allows, for example, a CD-ROM of the Bible, with the access program
compiled for a particular computer and put on a floppy.

Here it is possible to "write a program for a different computer" and still
use the CD-ROM.

2. The CD-ROM is stand alone. the access program(s) are on it.
These discs are often much more machine specific.

Compatibility:

1. The Atari (with its CD-ROM software) can read the identification area
of any comformant CD-ROM.
2. The Atari can read the data blocks from the first partition. Even if

this is in some "nice" format (ISO), the contents is likely to be compressed (maybe encrypted) and intended to be read only by a program capable of interpreting it.
3. If the CD-ROM disc is for IBM, the IBM emulators cannot easily connect the (IBM) program with the hardware. Ms/dos requires mscdex and a driver to be loaded, and the emulator has to emulate the drivers io command.

(I did this for PC-Ditto I. It works.)

4. If Spectre GCR/128 was to permit this something similar would have to happen. (I just read and AD for a PC emulator on the MAC -- This low cost version leaves out this support; the expensive one includes mscdex, and a driver for them to emulate.

p.s. mscdex == MicroSoft CD rom Extensions. The combination of mscdex and a driver looks just like the Atari Pseudo-DOS/driver/protocol modules.

4083. Re: GCC/G++ 2.1 Problems

Newsgroup: comp.sys.atari.st
Date: 1992-04-22 16:10:51 UTC
From: bammi@acae127.cadence.com
Message-ID: <BAMMI.92May4235451@acae127.cadence.com>
Source record: 223213

```
> btw: Could anybody give me a _complete_ list of all the enviroment vars that
> are needed or usefull for gcc 2.1?
>
> nils-henner

you should really be reading the file gcc-st.tex that details all such
aspects of the gcc port: but anyways here are the importants ones

Fisrtly gcc.ttp should be in your PATH or of course you can use a full
path to it.

GCCEXEC where to find exectables. the value of GCCEXEC is prefixed to
the executable that gcc.ttp is trying to run. A typical value
is "e:\gnu\bin\gcc-", so that when gcc.ttp tries to run say
"cc1" it actually looks for $GCCEXECcc1.TTP == e:\gnu\bin\gcc-cc1.ttp

GNUINC a ',' or ';' seperated list of directory names. This is where
gcc looks for <include.h> files, by prefixing the filename
with each of the directory names in order until it is found.
Typical value is "e:\gnu\include,d:\include,c:\include", so
a #include <stdio.h> is looked for in
e:\gnu\include\stdio.h if not found then
d:\include\stdio.h if not found then
c:\include\stdio.h
The value can be simply "e:\gnu\include" in which case only
that directory is searched.

GNULIB again a ',' or ';' seperated list of directory names where
library files are searched for. typical value
"e:\gnu\lib,d:\lib". When looking for a library file specified
as -lgnu, it will look for
e:\gnu\lib\gnu.olb if not found then
d:\lib\gnu.olb
if -L<directory> is also specified, that <directory> is
searched first before $GNULIB.

Also, the startup file crt0.0 (or gcrt0.o, when -pg) is looked
for in the first directory specfied in $GNULIB, ie
e:\gnu\lib\crt0.o (and nowhere else)

Also if when looking for a <include.h> file if it is not found
in any of the directories named by $GNUINC, or if GNUINC is
not in the environment, then each of the directories specified
by $GNULIB is searched.

GXXINC a ',' or ';' seperated list of directories searched when
looking for a <include.h> file from a G++ source file.
```

if not found in $GXXINC then $GNUINC is looked at and failing
that the direcories in $GNULIB are searched. This way common
include files between G++ an C can be shared by only putting
the g++ specific files in $GXXINC (even files with the same
name). g++ libraries are always looked for in $GNULIB.

When compiling for MiNT (gcc -mint),
- the preprocessor symbol __MINT__ is automatically defined.
- the startup file's name is mcrt0.o (or mgcrt0.o when -pg)
- the libraries -lmint -lgnu are looked for.

Of course, this presents an obvious possibility:

Third-party documentation. Gribnif/PureInc(?) isn't allowed to write an
English manual, but does this prevent someone else from doing it? Sybex
has no such agreement with Borland... Nor do you or I. Here's a thought:
1) The "Net" version, written using TeX. "Freeware" - printed copies for
$25, available from (name the User Group).
2) Gribnif could be encouraged to write something (possibly?) I don't
know if this would conflict with the Borland agreement.

>

I don't think so. I used to work for TI (condolences accepted), albeit
not in the semiconductor or computer groups. As I remember it, the CPU
was (a version of) the TMS9900, which is a 16 bit (internal) machine. It
had something like 72K of ROM (awesome for it's day). And if TI had not
totally blown the packaging (originally chiclet keys and a totally
closed architecture without a vast array of I/O ports), I daresay that
we would be comparing our Atari ST to TI-compatibles rather than (IBM)
PC-compatibles. In other words, it was a much more powerful CPU than
the 8088 that IBM used and could have set the standard *IF* TI had an
open architecture. That is one of the "big ones that got away" for TI.

4088. Problems w/BRAND NEW Mega STe

Newsgroup: comp.sys.atari.st
Date: 1992-04-22 19:45:13 UTC
From: oddjob@oz.plymouth.edu
Message-ID: <1992Apr22.194513.8674@oz.plymouth.edu>
Source record: 223218

I just a Mega STe and ran into a serious problem....

Whenever I try to run ANY program (so far...) I get 3 bombs in the
left side of the screen and the computer freezes. Does anyone have any
ideas ? This is very annoying %-). Could it be my hard disk driver ?
It's version 5.2.0 from ICD..... is that too old ??

ANY ideas would be great.. I really NEED to be using this machine
today..... and don't want to wait for it tobe replaced......

(Oh yeah..... files on the boot disk (in the autofolder/acc's seem to
work fine..... but nothing else.....)

>| Michael Fischer <fischer-michael@cs.yale.edu> |
>==

Yes, your right. I was thinking that he and his wife would literally SWAP disks in which case, each machine would sense a media change, but I see where that's probably not the case.

However, didn't the original poster also say that they didn't want to have to learn any new habits and was accustom to hitting a certain save command?

What if there was patch program that would change the floppy serial number each time a media change was detected? Like, her machine senses a media change and changes the serial number (it has to read the fats, etc anyway). Then when placed back in his machine, media change, new serial number, etc.

I guess my point is moot since I don't have the skills to write the program mentioned - yet.

Regards,
Doug

4092. Re: TeX for 1MB + floppy, Possible?

Newsgroup: comp.sys.atari.st
Date: 1992-04-22 23:40:09 UTC

Message-ID: <1992Apr22.234009.23014@csi.uottawa.ca>
Source record: 223222

> I want to install a minimum, and i suppose it'll have to be,
>of TeX on my 1MB, floopy STe. Is this possible, and if so is there
>a doc file of some sort that could tell me what i can/can't install.

Not plausible.
Minimum would include (well, this is a partial list. But it's big enuf to
prove the point...)

tex.ttp (197K)
plain.fmt (150K) (this means NO LaTeX files - latex.fmt takes 294K)
assorted font files (probably 300K worth, for a typical document).

This alone adds up to the 720K mark.

And it is the ABSOLUTE minimum. You'd need to put the input/output
files on a RAMdisk, and with only 1MB, you don't have room for that.

Plus, this would NOT run LaTeX - which is assumed for a lot of the stuff
you'd get.

It MAY be possible to run a stripped-down TeX which only has a couple of
fonts (which means: no math), but I wouldn't want to try it.

Oh right, you also would need to have some sort of shell, in order to
set up the environment variables. It costs you some combination of
RAM and disk space.

It ain't gonna work.

If you had a hard drive, then there would be NO problem. (Indeed, the
package CS-TeX for the ST is better in my experience than many of the
versions for other computers. And it's free, to boot.)

- No this is a full English version..

You're incorrect. Pure C has always been in English in the program
itself, and Gribnif is selling German docs with it. The box/packaging
might be in English, but it's almost exactly the same as it's always
been. English interface, German docs.

>ANY ideas would be great.. I really NEED to be using this machine
>today..... and don't want to wait for it tobe replaced......
WHich was one of the suggestions I did get..... something about
jumpers not being correctly set w/in the computer, making use of an
external Hard drive wierd...
>(Oh yeah..... files on the boot disk (in the autofolder/acc's seem to
>work fine..... but nothing else.....)
All this means is that AUTO folder programs, .CPX, & .ACC's work fine.

I went and got 5.5 from the ICD BBS and it doesn't seem to solve the
problem. I did find a way of getting to my HD though....

If I boot from a floppy & THEN run ICDBOOT (did I mention that
programs work fine from a floppy if the HD driver is NOT loaded ?)
[assuming I can get to this step] I can access my hard drive just
fine...

Obviously, something about the ICD utilities is strange..... when
mixed w/a Mega STe(in NH, in the early spring..... etc.).

I'm clueless..... I haven't tried the Atari hard drive utilities
yet... maybe that'll fix the problem. But I would rather NOT have to
reformat if possible.

> Benchmark programs are usually not programmed for speed, but to test
> the speed of a programming system or a computer system.
> Did you do the corresponding optimizations in the GFA program too?

No -- I don't have GFA. I found it disturbing, though, that this particular ``benchmark'' was being (mis)interpreted as something more than what it was: an illustration of a freak situation. The C compilers that I've used all employ function libraries to handle floating-point arithmetic, and the example program (which was published in the Atari Explorer) exploited that fact. GFA does produce a faster executable in the narrow example, but it's a mistake to extend that to any broader conclusions. Real-world programs don't do what the example program did.

> I have never tried 'official' benchmarks, but from the comparisons I made

> comes to major differences in speed when the structures used by the
> languages are different, which is most evident in the case of string
> operations. Here, C is likely to be significantly faster, but then, GFA
> strings are more convenient, more powerful and more versatile...

Good point (although I personally like the way C handles text). Similarly, a C compiler with 16-bit ints may produce executable code that shuffles integers around faster than a compiler that works with 32-bit ints. That doesn't mean that 16-bit compilers are inherently superior. Neither does the Atari Explorer example prove anything general about GFA BASIC.

I don't mean to suggest that GFA is a bad language, slow, or not useful. In many cases it's easier to use than C, and for many individuals it's a better general-purpose tool. I do take issue with claims that it approaches C in flat-out performance on any real-world tasks, though. I still have not seen a case where a GFA program is in the same league as properly written C code.

> When running a program from the desktop, does the program grab most of the
> remaining RAM? When I run FLASH or WordWriter, I get about 37548 of free RAM.
> When I run FirstWord (which expects to run its printer program later), I get
> about what I would expect from RAM - program size.

You guessed right. When GEMDOS launches a program, it allocates ALL
of the free memory to that program. It's the responsibility of the
program to calculate how much it needs and return the rest to GEMDOS
by calling the Mshrink() system function. This makes the memory
available for dynamic allocation through the Malloc() system call,
and leaves the memory free for other applications (such as child
processes, etc.) Since First Word is looking ahead at running its
printer program, it frees memory that's not immediately needed and
uses Malloc to get more later as necessary.

GEM needs about 32K of elbow room in order to work properly. It looks
as if FLASH and WordWriter are looking at the total amount of RAM,
subtracting a chunk for GEM and freeing it, and holding onto the
rest. This may have seemed to be a good idea to the authors of FLASH
and WordWriter, since it allowed them to avoid some irritating
peculiarities of GEMDOS dynamic memory management, but it is
obviously not a good idea if we start running multitaskers.

I think the Pexec Cookbook is available from atari.archive.umich.edu.
In it you'll find a lengthy and technical explanation of the memory
ownership issue. If you're really interested, you also could look at
the source code to dLibs and the MiNT and GCC-ST C libraries. The C
runtime startup code performs the computations and frees the memory
not needed by the program.

> computer, powered by an 8-bit Motoroloa 6502,

ah, the senility of old age. when I were a lad, computers only had 8 bits and the ti 99/4a was noted for being the first 16 bit computer running with the 9900 cpu. Motorola made the 6800, MOS Technology made the 650x family.

The history as told to me by MOS Technology employes goes something like this:
Chuck P(something like pedle) and his team designed and built the 6800 at motorola. Being good little IC designers they cam up with the outline of a cheaper, smaller, faster cpu. When they posed the idea to Motorola management, they were turned down because the new chip would cut into 6800 sales. So Chuck and his team looked around and found MOS Technology (not to be confused with MOSTEK another defunct sillicon house). MOS Technology made calculator chips and simple video games. Their biggest vendors were commodore and coleco. After a bit of talking, MOS Technology agrees to provide Chuck and team a home and produce the chip.

The first results of their labors was a resounding success. The 6501 was a 20$ cpu that was pin-for-pin compatable with the 6800. apparently so many people jumped chip that Motorola did the american thing in response to technological competition and sued MOS Technology. The end result of the lawsuit was an out of court settlement where the 6501 was withdrawn from the market and MOS Technology was a greatly weakened company. According to my sources, the only thing that kept the company alive was sales of the KIM-1 and 6502 as the calculator chip market had just gone asian.

I'm not too sure of the timing on this (faulty old-codger memory) but at roughly the same timing as the lawsuit, this calculator company (commodore) was buying ever an increasing number of calculator chips at ever increasing credit terms. Well, does anyone remember the calculator that couldn't calculate the cosine of 90 degrees? That was the chip responsible for the downfall of MOS Technology (or so the story goes). Commodore wanted MOS Technology to take back the bad chips and give them (fixed) new ones. MOS couldn't because it didn't have enough capitol so they somehow transfered themselves to commodore and became a subsideary

of commodore. And this is how Jack T. got into home computers.

for those of you who didn't know what a 99/4a was, A kim-1 was the first 6502 based single board computer. it had a software uart (good to 9600 baud) a sw cassette port (good to 600 baud) a hex keypad and display. it was a fantastic machine for learning about microprocessors. I have very fond memories of making it do all sorts of things my bosses thought couldn't be done without an "expensive" 8080 development system. One of the neatest hacks I have ever created was the interupt driven kim-1 cassette interface. I needed to sample data and write it to tape but I couldn't use interupts to sample the data because it screwed up the sw loops that generated the tones for the cassette interface. So I sampled data in the foreground and used interupts from a timer to trigger lo-hi and hi-lo transitions on the cassette port thereby creating the correct tone.

enough rambles for now.

In future, if you're going to take the time to reply to my messages,
please READ them first (as a courtesy).

>Also, the pricing has been changed. Gemulator Lite has been dropped
>altogether, so the real Gemulator will cost $199 + TOS ROMs, so
>you're looking at under $300.

Could that be because the Gemulator Lite was going to be software
based and Atari said no? Could this be part of the reason you
seem to bear such animosity towards Atari?

>Your pricing of ST equipment is way undervalued. You're telling me
>you can buy a used 520ST and color monitor for $150? Maybe so,
>but it's probably not in great shape. Let's talk about someone

>Then they have to upgrade the memory (Calamus and most other major
>apps won't run in 512K), upgrade the TOS, buy hard drive, etc.
>And most likely they'll buy from a dealer who isn't going to sell
>the machine for $50. Using your argument, I can go buy a used 386 for
>$500 instead of buying one new from a dealer for $1000.

Let's talk about people with businesses who want computers. I know
many business owners with machines that AREN'T <gasp> MS-DOS boxes.
A good portion of these are Atari ST owners.

As for DTP programs, there are a variety of quality DTP programs
for the IBM/clone market. Why haul your personal copy of Calamus
or Pagestream to work every day to use on a DOS box. Why not
use a program that is optimised to work on the system you're using?

I purchased a 520ST for $50.00 in December. It runs all my TOS 1.0 programs, does MIDI & has a Yamaha sound chip. My 1040 STE cost me $389 (new) about a year ago. If I were a business owner who wanted to run Calamus or Pagestream, I could purchase a new Mega 1 STE for $550 (from San Jose Computing). I could pick up a few extra SIMMs for $35 a piece, and buy a hard drive. Sure, it might be more expensive than your $199 + $60.00 for TOS, but then I have an STE.

I don't question the possiblity of emulating the 68000. I question the ability of a PC being able to achieve ST or better video speeds with the painfully slow bus architechure of all but the most expensive PCs. Exactly how fast is your screen refresh rate? And how much data can you send to the card at one time?

>As for speed, again, the product is not finished. My goal for the
>Toronto show was to demonstrate a near 100% compatible ST emulator, to
>disprove all the self-appointed 'experts" who kept claining that is was
>impossible to emulate the 68000 on a 386, and if it was, then it was
>impossible to emulate the ST hardware. Well I proved them wrong. Now I
>am going through and optimizing the code, writing everything in
>assembler, etc. When Gemulator ships it will be a lot faster than what
>I demoed in Toronto. A 486/50 is nice but you don't need it.

Great! You'll optimize the code so it runs faster, but you're limited by the design of the machine you're running it on. You can make a VW Bug look like a Porshe, but no amount of "optimizing" will make it run like one. (I'm not talking about processor speed, I'm talking about video speed).

>People have plenty of reasons for wanting to buy Gemulator. Just read
>the postings on comp.sys.atari.st. Some people are hundreds of miles
>away from an Atari dealer, some people have to use a PC at work and
>would prefer to use ST software on it, some are fed up with Atari's
>promises which never materialize - from the 1450XLD to the transputer
>to the "under $1000 TT" to the ST notebook and pen computers. Theere

The 1450XLD was a Warner decision and had nothing to do with the Tramiels at all. The ATW8000 transputer exists and is operation in Europe and Canada. The TT is pretty close to $1000 right now, and the prices are dropping. The ST Book was recently released and is in production. As for the STylus, it was stopped due to lack of industry interest in pen computing on ANY platform (they're nifty, but people don't seem to want to buy them). You appear to have a personal problem with Atari, and seem to want to share it with everyone else.

>are 400 PC manufacturers who make tens of millions of PCs, and they
>don't have to resort to vaporware and whining about the prices of RAM
>chips or whining about how the FCC won't approve them. And they
>advertise. I own 3 PCs. I know that 5 years from now they are not going
>to be obsolete. Maybe a bit slow, but MS-DOS and Windows software will
>still be the major software then.

>- Darek

You exaggerate your statistics to suit your own purposes ("400
PC manufacturers who make tens of millions of PCs"... yeah sure,
total from 1980-1992, maybe.)

You claim that your 3 PCs won't be obsolete in 5 years? Can I
borrow your rose coloured glasses? I see reams of software
being produced for the 286 (the darling of 5 years ago). Not.
And Windows 2 runs like a slug on it. A friend of mine has the
IBM clone I used 5 years ago, and it's not just "a bit slow", it's
downright painful to watch. With the 586 chip looming on the
horizon, and RISC technology a real option, you have the balls to
say that your 3 machines won't be obsolete in 5 years? And
"MS-DOS and Windows software will still be the major software
then"? Yes, we know who writes your paycheck every week.

Don't patronize me.

4109. SCSI-interface

Newsgroup: comp.sys.atari.st
Date: 1992-04-23 07:24:39 UTC
From: leo@ahx.hobby.nl
Message-ID: <1300@ahx.hobby.nl>
Source record: 223239

Hello,

I like to play with the SCSI interface present on my atari TT. I have found a Minix driver for SCSI written by Bruce Culberstson that was using the same chip as present on my TT (NCR5380). But when I try for instance to reset the SCSI bus as described in that source code the controller seems to go nuts.

To access the chip, I use the odd addresses starting at FF8780. The code to reset the bus looks like:

```
reset_bus()
{
int i;
unsigned char *chip = (unsigned char*)0xFF8780;

chip[5] = 0;
chip[1] = 0;
chip[3] = 0x80|0x40; /* assert RST?? */
for(i = 0; i < 100; i++);
chip[3] = 0x40;
chip[15] = 0x6|0x80;
chip[15] = ~(0x8|0x4);
for(i = 0; i < 5000000; i++);
}
```

After this code has run, all registers on the chip seem to contain 0xff????

If there is anyone who has any info on the TT SCSI-bus or on the NCR5380 please respond. I am also interested in other one's code to access this bus.

My email address is: leo@ahwau.ahold.nl

Thanks in advance,
Leo Weppelman.

16K (reasonable at that time) of video RAM, i.e., the processor couldn't
address it directly. It could, at considerable cost, be expanded to 48K.

>You had to buy a ridiculously expensive disk system before you could do any
>machine code work on it (no PEEK or POKE in the BASIC). Someone had a look
>at why the BASIC interpreter was so damned slow and discovered that the

Check out an issue of Creative Computing, which published a BASIC benchmark
every month with execution times for many systems. The Atari 8-bits came in
at ~8 minutes to run it (one of the slowest) and the 99/4A took ~12 minutes.

They did have a 4K battery backed up cartridge which allowed you to program
in assembly, though the assembler was written in BASIC (slooooooowwww). Also,
an Extended BASIC cartridge gave you limited PEEKs and POKEs (can't remember
how) and access to 28 or 32 one-color sprites (nice).

>Redeeming features included the terrific speech synthesiser add-on, and some

The speech synthesizer was good. Parsec (I agree, awesome!) got it to speak
with a female voice (considered impossible by some). Don't forget
TI Invaders, a clone of Space Invaders. It blows away any version I've ever
seen. Good enough to make you keep a 99/4A around.

>AT&T Bell Laboratories
>Naperville, IL

Hi Jim!

Overwriting a file or a part of a file with stuff that supposed not be
be there while moving files, is a problem of the TOS or of your hard
disk driver!! There is also the possibility that a problem with the
power supply from the plug caused that error.

The last 5 lines of your source code probably belonged to a new sector.
What happen? For some reason the FAT was mixed up. The FAT stores the
informations about the file: where they start, on which sector the
next part of your file is, and where it ends. There are also
informations aroud, that give information about free and broken
sectors - they are mapped out.

I'd revcommend to use a tool that checks your hard disk (links in the
FAT, etc.). I have a hard disk from ICD. There was a little tools with
it, called cleanup. That does exactly that stuff and repairs possible
errors. But that program is not in the public domain.

4114. dbMAN V

Newsgroup: comp.sys.atari.st
Date: 1992-04-23 10:55:48 UTC
From: kllove@uokmax.ecn.uoknor.edu
Message-ID: <1992Apr23.105548.15394@uokmax.ecn.uoknor.edu>
Source record: 223244

Well, I don't know how I found the time but I've actually read
this group on a daily basis for 3 days in a row. I'd still prefer
e-mail though.

My question is pretty simple: Does dbMAN V ver. 5.2 (higher?) support
the use of arrays? If it doesn't then I won't bother with it. In
which case, I would have to purchase an IBM compat. laptop to do work
on. :(

I've got several accounting packages written in DBXL code. Unfortunately,
I have used several arrays to help refresh the screen faster. I know
that dBASE III+ doesn't support arrays and dbMAN is supposed to be
compatible with III+. I would rather not rewrite the code if at all
possible.

Does somebody know an address and/or telephone # for the makers of dbMAN?

Before I forget, does anybody know if overlays are possible? The Class
Act system (and a few other prgs that I wrote to go with it) compiles to
about 2.1 MB on IBMs. If I were sell this system on the Atari platform (the
licensing agreement may prevent this anyway) then a 2 MB RAM requirement
would be unthinkable. What does dbMAN's compiler do? Create *.obj files
for a linker or create an executable file or some intermediate form such
as d-Code?

adTHANKSvance,
Kenneth Love

>I don't need TT support..

>So what versions support what...??

I upgraded from 3.0 to '3.6 TT' It was worthless. The upgrade (unlike
what somebody mentioned) is hardly worth $55, unless you have an STe or a TT.
The only new features are improved TT compatibility, some matrix functions, and
the ability to deal with the >512 colors of STes and TTs. Hardly worth the $$.
(I got 3.6TT in June last year, so it's not unlikely that there's been a new
version since then.) Until I get a TT, I'm not about to pay $55 for a few
matrix functions that I can code myself...

>Does anyone see anything obvious? Thanx again.

Maybe it's a stupid remark, but I can't see how you can determine from the length of the environ[0] string that you're running as a GEM-application or a TOS-application. As far as I know there is no standard way to determine this (although a friend of mine once made a Turbo-C hack that works reliable). You should know the name of your program in order to know if it's GEM or not. Programs ending as .PRG or .APP are GEM; .TOS and .TTP are TOS - but what if the user is allowed to change the program-extension and start it from a shell - in which case you're (in general) not able to locate your own program and find out its name (-this is precisely what my TC-hack makes possiblle, though :)

Your code supposes (as far as I understand) that strlen(environ[0])==5 signals GEM-use... This can't be correct - what if one doesn't use an environment at all? The length of the env-strings has in principle nothing to do with the difference between TOS and GEM.

BTW: Your GEM_Init code is just the normal way of installing and initalizing a virtual graphic workstation. This should only be done when you're running as a .PRG or .APP, otherwise the machine will crash. The same applies of course to the use of menus, dialogs and all the other GEM-stuff.

>***end of original posting ***

NO, all wrong.
I asked for a GL-Viewer. You speak about a Converter from HPGL
to some other formats. GL-Files have nothing to do with HPGL-Files.

What are HPGL-Files ?
HP defined some years ago a language to be interpreted by HP plotters.
For plotters, HPGL has become something like a standard, so many
drawing tools can produce HPGL output.
=> boring .

What are GL-Files ?
GL-Files contain images in several fomats (gif,pic,clp) , fonts and a
description what to do with the images and fonts.
GL-Files are interpreted by a GL-Viewer.
With GL-Files, animation sequences, scanned for example from a VCR,
can be played back in realtime.
=> interesting !

|> TLB-Mindbomb megademo).

Don't forget that there is supposed to be a '56001 DSP on the Falcon.
This accesses a 24 bit word per memory address. 24bit true colour is the only
way to go if this chip is to be used for graphics efficently.
Since the '56001 can do 1 arith op & 2 moves every instruction cycle
it should be possible to do 3d shading at close to full memory bandwidth.
Then you would have no problem doing "3d gouraud shaded vertical
twisting scrollers" without messing about with palette flicks. In fact
the '56001
is a demo coder's dream come true - it's purpose built for horribly subtle,
amazingly fast assembler hacks.

|> 24bit word for each I know there's no chance you can have 256
|> palette registers on a shifter chip without going to some sort of
|> internal ram, but wouldn't a better solution be to make say the bottom
|> 16 colours go through palette registers?

What do you think the 16 colour regs on the ST are if they are not RAM on
the shifter chip? The problem really is "Is there enough room on a shifter
GA for 256 words of 24bit RAM?". BTW Doesn't the TT have a 256 colour mode?

|> I've also programmed Acorn
|> Archimedes. It's 256 colour mode was a *real* mess. The colour you see

|> bits from 1 of 16 palette registers. The result was that many of the
|> 4096 colours were only available from 16-colour (or less) modes. Why
|> don't these computer manufacturers think before they make thousands of
|> people suffer for 5 years?!!

Yeah, all the micro computer designs I've ever seen are suboptimal given
the available chip technology - but then it's one thing to design on paper
and quite another to build & sell in volume. I'm sure Atari will find a
way to screw up with the Falcon's video system - they might even hang the
DSP off a port and not let it access video memory at all :-(

>should know the name of your program in order to know if it's GEM or not.

Hmm. That's not true either: if I take a shell - say, 'shell' - which I start
as 'shell.tos', and I give the command 'life' the life program - being called
life.prg - will be fooled into thinking it is running as a GEM program if it
examines its own name.
For the same reason, you also cannot assume that you're a TOS program only
because you received parameters.

IMHO, it's easier than all this suggests: if you want to make sure you have AES
functions, then ask so. If you're not allowed to appl_init won't give your app
a handle. Do you need VDI functions? Open a [virtual] workstation, if you don't
get a handle: no VDI. Easy.

4121. Re: MiNT Hardware scrolling

screen memory
|> is changed. Right??
|>

Right - the data in memory stays where it is while the screen position moves
by 1280bytes. The slight problem is that as the screen drifts thru memory
you eventually run out of memory. There are several ways of handling this.

One way is to have a software wrap-around of the screen memory by modifying
the screen base address during hsync. This requires fairly accurate timing and
can probably only be used in demos and games.

Another way is to keep _two_ copies of the screen in consecutive
memory, writing new lines of text to both. As the screen scrolls you
gradually move from the first to the second. When you get to the point
that the second screen would be fully displayed you can flip back to the first
so you always stay in the same 64K block of RAM.

The big drawback of hardware scrolling is that it only works for the full
screen - not for GEM windows.

>-George

This is actually an interesting post, I think. I think I'd agree...if I ever REALLY wanted to move to a PC, I don't think I'd be looking to save the capability to run ST software. The only possibility might be MIDI stuff, I don't really know, since I don't have any. But I imagine the MIDI implemntation on Gemulator might be the most difficult thing...perhaps not on the Gemulator side, but maybe the PC's hardware side.

The interesting possibility via Gemulator, it seems to me, is the ability to use Spectre for Mac emulation. I don't think there has ever really been a Mac emulator for the PC. There had been a lot of talk about one coming out (at various times, and by different people/companies), but I don't think it has ever materialized. If anybody knows about a Mac emulator for the PC, I'd like to hear about it. If there is none, then here's a reason to get Gemulator...i.e. if you've got a significant investment in Mac software already...and if Gemulator can do a decent job doing a Mac via Spectre.

I haven't seen any discussion of this for quite a long time, so I thought I'd give it a shot again.

IS anybody out there using ATSpeed with a cache on their hard disk?

When I was messing around with this a year ago or so (or more), I found that all caches just chewed up my hard disk. I was then told by the distribuor not to bother...that none would work. So, I was just wondering if things have changed since then.

4133. Re: wordwriter disk writes

Newsgroup: comp.sys.atari.st
Date: 1992-04-23 14:35:37 UTC
From: jtrimble@sdf.lonestar.org
Message-ID: <1992Apr23.143537.20408@sdf.lonestar.org>
Source record: 223113

Here's a summary of the potential solutions I received when I queried about goofing up disks by switching them between two st's both working on like-named files.

The problem arose for us using Timeworks WordWriter v.2.00, but it sounds as if it comes up in other places as well, so I'll pass along all the suggestions.

A)The ever-popular "eliminate human error". "Keep track of what you're doing...and don't do the operation that screws things up."

B)"Use only one disk, and swap it." Actually, this the least likely source of the problem, we think. I seem to have been confused by the multiplicity of disks, and led everyone down that same path. I now believe it's the one disk that's been changed by the other machine since the current machine last read it as much as it's the misidentified disk. Perhaps even moreso! [Sometimes I can't believe I'm a professional writer, saying this kind of stuff!] However, saying, "pass the disk please," could help us slow down and deal with A).

C)Label disks "his" and "hers" and label files with identifiers, and don't switch them. This suggestion carried a little further to "Never save over an old file--always rename the file when you save" could surely take care of the problem! It would also unfortunately create the problem of gazillions of file name/numbers/identifiers--at least for us. Like most professional writers, we write and rewrite and rewrite and rewrite and rewrite... In some cases, with a good identifier system, it ought to work, though.

D)Share one of your external drives through a switch box. An ingeneous idea that would be much cheaper than sharing a hard drive--all we'd need is cable and switch! But it doesn't address the issue of the disk having been altered by Computer A since computer B did it's last write. I now believe that having more than one disk in the mix is not really the problem. It's having more than one computer on those disks!

E)If you formatted on DOS or some other format system, you might not have "proper" serial numbers on your disk. Therefore, one more reason your computers can't tell the disks apart. (We didn't format on a PC, but this might be a problem for someone else.) The suggested solution is to use "uneekit" (from atari-archive as diskutils/uneekit.zoo) which should put a unique TOS readable serial number on PC- formatted disks.

F)If you initially used a copy program to get certain shared files onto both disks, then both disks would have the same serial number. GUILTY! I HAVE, in fact, copied whole disks of text so that I and my wife could both work at the same time. This is the suggestion that made me realize I might have been having so much trouble tracking down the problem, because it might have been more than one problem. Presumably, uneekit would fix this, too. (?)

G)Put "fmc" program (available at atari-archive as diskutils/fmc.arc) in your auto folder. Every time you save, fmc (forced media change) accesses the disk to see if a change has occurred. Perhaps J.R. who suggested this program, or someone who knows lots about it will know if it could be thwarted by the serial number syndrome described in F). I.e., does fmc just read serial numbers, or the whole FAT, or what? I've e-mailed the archive for fmc, but have yet to receive it to test it out.

H)Always force disk read/flush the disk info out of memory by "Open"ing an intermediate, UNRELATED disk before doing "Save"s.

This brings up something I noticed just today, as I have just started using/trying zmodem using a program called xyz.ttp. I run xyz.ttp from ramdisk and download to a folder on drive A. I have to open the disk on drive A and then cancel before I receive zmodem, or else I get an error message--can't find folder or folder doesn't exist or something like that. I guess this is the same phenomenon.

J)Get another word processing program, followed by suggestion. This is the sort of answer I'm sure the software companies love to see. I'm certainly open to suggestions regarding my next word processing software purchase--but I'm not likely to change just over this oddity. Unless I can't find an easier, cheaper way to fix it. Or I write a bestseller of some kind! Hell, I'll take suggestions on that, too!

This brings to an end the suggestions received to date. Many thanks to the many helpful folks who replied!

4134. Doing the overscan mod myself

My guess is that you do not have a declaration for lcalloc; so it defaults to
int. As MWC uses 16-bit ints, the 'head' variable only gets 16-bits of the
address, and the top 16-bits will be set to all zeros or all ones (sign
extension). Hence, head is likely to contain an invalid address, so
you get the address error (3 bombs).

Try adding a "void *lcalloc();" declaration, or find a header that
has the declaration for you. This is a common bug in C code with
16-bit ints.

I have nothing against Darek & his emulator, but I am sick and tired of this argument people use for buying anything! Look, MacDonalds sells a lot of hamburgers - that doesn't make them taste any better! FORD sells more cars than anybody else - but they're still FORDs, they're not BMWs. Just because somebody advertises a product and sells a whole bunch of them doesn't mean that the product was superior - it just means a bunch of people got duped! Also, when is the last time that anybody saw a "clone" manufacturer advertise on TV?? Advertising may translate into sales - but it also directly translates into higher prices! The purchaser ALWAYS pays for this in some fashion. Look people, we're all not lemmings - so just because 10 zillion people bought a PC doesn't necessarily mean that a PC is a superior product!

>Oh yeah, I don't have a compiler for GFA, does anybody know if my
>version has one available?

The complier is $39.95 from them. Order number is AT-B20-SYS.

>Has anybody got a program to convert ST BASIC programs to GFA? Will I
>have to do it by hand?

There was a program on the 2.x disk called 'STKILL' or something like that
that'll change a STBASIC listed program to a GFA program. You'll still have
to do some debugging, but it does most of the work for you. (Been a long time
since I saw that program though....)

4140. GCC/G++ 2.1 Problems

Newsgroup: comp.sys.atari.st
Date: 1992-04-23 15:24:56 UTC
From: malay@sae.com
Message-ID: <1992Apr23.152456.24505@sae.com>
Source record: 223120

After installing GCC/G++ 2.1 I tried the 'ol "hello world" test:

```
gcc -v hello.c
gcc-ariST version 2.1 Patchlevel 1
c:\bin\gcc-cpp.ttp -lang-c -v -undef ......................
GNU CPP-ariST version 2.1 Patchlevel 1
c:\bin\gcc-cc1.ttp c:/tmp/cc100000.i ........................
GNU C version 2.1-ariST Patchlevel 1 (68k, MIT syntax) ........
.
.
.
```

and so on, produced a viable "a.out" which ran fine.

Then I tried this:

```
gcc -v hello.cc
gcc-ariST version 2.1 Patchlevel 1
c:\bin\gcc-cpp.ttp -lang-c++ -v -undef ......................
GNU CPP-ariST version 2.1 Patchlevel 1
cc1plus c:/tmp/cc100000.i ..............................

cmd exit code 1
```

Just what happened here?? "cc1plus" should be c:\bin\gcc-cc1+.ttp - It appears to me that gcc-cc1plus.ttp is too long of a file name and that somebody left the hard-coded name "cc1plus" in the gcc.ttp program when it should have been changed to "cc1+" for the ST. Am I missing something here? I would bet that if I changed the name of gcc-cc1+.ttp to cc1plus.ttp and changed all the other gcc executables such that the "gcc-" prefix is not there and changed my environment variable accordingly then everything would have been hunky-dory - BUT that seems like too many changes. Can somebody fix gcc.ttp???????????

Also, GCC2.1 needs to have the updated libg++ libraries and the updated include files made available. You can get the include files from update18.zoo but the libraries are not available.

^^^^^^^^^^^^^^^^^^^^^^^^

|> (void) fread(head,dumpsize,1,fin);
|> fclose(fin);
|> printf("%ld bytes read from %s\n",dumpsize,fid);
```

At first try 'rewind(fin)' instead of 'fseek(..., SEEK_SET)'
The seek modes are defined as SEEK_SET, SEEK_CUR and SEEK_END,
e.g. 0,1,2, (or was it for lseek() only).

I think it could be important to print out 'dumpsize' after the
first fseek() and ftell(). It _must_ be the length of fin (is
it on my Unix system).

Or try an offset of 1L in your first fseek().

Then check the structure 'fin' and all it's contents, especially
the current file position, after each fseek() operation. Do it
with a ftell() call or with fin->fpos (?) or in any other way.

Then decrease dumpsize before fread() to see if fread() fails.

But I think one of your library functions has a bug. (I use
gcc and Turbo C, so I don't have any experience with your
compiler) ap.

4142. NeXT & Atari marriage?

Newsgroup: comp.sys.atari.st
Date: 1992-04-23 16:06:00 UTC
From: Nick.Smith@f47.n282.z1.tdkt.kksys.com
Message-ID: <704064906.F00002@tdkt.kksys.com>
Source record: 223122

Next and Atari sleeping together is not such a far-fetched idea;
Just got the summer issue of _NextWorld_ magazine and Atari and
other familiar names pop up. First Ditek announces DynaCadd 3.0
for NeXT at CeBIT, along with AMG debuting Avant Vector and tms
Cranach showing a beta of Cranach Studio for Next...
In Lt. Sullivan's gossip column: re; porting NeXTstep - 'even Atari
are being courted... Did you know that Atari's 68030 is beginning to
nip at the heels of high-end Macintoshes... at half thier price?
Did you know as well that 68040 products due this fall will list
for 1/3 the price of Apple's Quadra line? Shrinkwrapped NeXTstep
for HP and Atari machines would make sense for markets that are
currently underserved.'
Is it no coincidence that mass storage vendor PLI is the NeXT's
largest 3rd party supplier? That the next generation Atari machine's
are likely to be in black boxes (like PLI's offerings and NeXT workstations)?
That use of a 56001 DSP is rumoured
Added all together, it doesn't seem so far fetched at all..

Yes, well, I have heard of the Internet and ftp. I would hardly be here
if I hadn't...

I do question 'free or cheap shareware'. The way I understand it, share-
ware cannot be free - freeware is. 'Cheap', again, depends on where you
live. A shareware author asking for USD15 or 30 is common, and not
unreasonable in my opinion. However, if the author is American, as most
Mac shareware authors seem to be, I, living in Europe, would have to
pay a bank about USD15 to send the USD15 or 30 to the author. I don't like
paying a bank USD15 for every DA I might use some day.

I originally referred to _big_ applications, those that don't exist as
shareware. (Maybe I should have spelled this out - I was a bit flamey
about people discussing Mac prices in an Atari ST newsgroup).

An example: Claris CAD, local educational price about USD910.
Another: Think C -"- 500

> if you don't get a handle: no VDI. Easy.

I confess, I'm in way over my head with this stuff. I started out writing a simple C program after starting msh. While I was in msh it worked fine. When I exited and tried to run the same program from whatever the machine boots up with (GEM?), the program bombed. So, I assumed, based on a few sketchy examples, that I needed this init stuff. Then I found it worked from GEM(?) but not from within msh... All I want to do is get it working when I click on the damn filename with the mouse, or type the damn filename into msh.

It's not meant to be incredibly portable and general, so I looked through the Mark Williams Lexicon, and found an example that showed how to read the msh PATH= string via environ. A few preliminary tests showed me an empty path string when running from GEM and a considerably longer one from within msh (because the profile file defines it). And msh cleans up after itself when it exits, undefining PATH again, giving me a string "PATH="... 5 bytes long.

Oh, when I run from msh, I want the program to take arguments on the command line. Basically, I prefer to run it from msh. But other people don't want to play click-on-click-on-click-on... to get to msh. They want to just click on my program and have it go.

(I created the executable by typing: "cc program.c" to msh, and it creates program.prg. Then when I added the GEM stuff, it wouldn't link, so I switched to "cc -VGEM program.c" and again, it creates progam.prg.)

Now the hard part: I was hoping to get it working by noon, Friday. Such is life.

So, let me ask the question a different way: Why won't the straight, standard, non-Atari code work when I double-click on the program name, and what's the *minimum* amount of junk necessary to make it work, without destroying the ability to type in the program name from msh? (I can even live with removing the arguments on the command line.) Keep in mind, I don't know shit about Atari's.

Thanx once again.

4145. Neodesk 3.0 inf files

Newsgroup: comp.sys.atari.st
Date: 1992-04-23 17:03:00 UTC
From: ender@uunet.uu.net
Message-ID: <1992Apr23.170300.11947@uunet.uu.net>
Source record: 223125

Greetingz! I have just completed a move and upon setting up my computer found that all of my Neodesk 3.01 inf files (that is, NEODESKL.INF, NEODESKM.INF, and NEODESKH.INF) are corrupt. Would some kind soul please uuencoded copies of the plain-jane versions of these files and mail them to me? In unpacking I have yet to find my distribution disk and hope to avoid having to send off for a replacement by getting working copies of the plain inf files and then placing all the appropriate files on a floppy for safe keeping.

I don't *THINK* that just asking for copies of the INF files would be considered piracy, but if someone out there knows different please let me know and I'll write to the company about getting a replacement distribution disk... But I shudder to think of how long I might have to wait and the regular Atari desktop just doesn't cut it once you've used Neodesk!

Thanx in advance!
- Ender

As a user of GFA basic with some experience, I don't see anything
inherent in GFA taht could accout for the fact that there are no GFA
programs 'in the same league as properly written C code'. Over here
in Germany, some GFA programs of nice qualtiy float around, e.g. Sagrotan
and Crackart (I think). It seems to me that it is perfectly possible
to write GFA programs that are just as good as equvalent C programs.
It's largely a question of your taste which language you choose...

Life must be rough in Finland. I bought Claris CAD at $170 and Think C at $80, both educational discount. I also purchased Wingz at $99, though its price has gone up to around $180 educational discount.

Do you have any idea why software is so expensive there? I am just curious.

Jess Holle

NO NO NO NO! When programs run from *my* desktop, they have a nice long
PATH= string. This will be true for anyone using my GEMENV program that
brings environment variable support to the GEM desktop. (And if you're
a desktop user, you *should* be using GEMENV!)

Okey, I know I'm a tad late to jump on the bandwagon here, but I just ordered a TOS 1.4 chipset to drop in my Mega ST4. (Yeah, yeah, I know about the TEC, but I mostly use monochrome and I'm don't ever see the desktop since I use Codehead's magic HotWire/MaxiFile/MultiDesk combo, so the new icons and things wouldn't do much for me.)

I'd like to know if some of my current AUTO file programs won't be necessary now (Pinhead, Fatspeed, FolderXXX), and what patch programs people have found useful to fix bugs in TOS 1.4.

Thanks,

Sure, there are tons of disk formatting programs on a.a that will format DSDD
disks to over 720 K. DC Format is a good one, Mega Format, etc etc...

I have formatted disks to about 926 K I believe, but of course if you want
to read them on MS-DOS machines this would be a problem. If not, go for it!

>Thanks.

P.S. - Disks formatted to this big will probably read and write slower, there
are also options to speed this up too, like Twister format and there is a
program called "Fast Floppy" or something which does this in a different way.

Message-ID: <1992Apr23.160025.10979@miavx1.acs.muohio.edu>
Source record: 223136

Ok, I've just started using MiNT, and I have a couple of questions:

1. I'm using the shell that comes with it, since it is the smallest one I could find, and with only 1 meg, I need it. However, I don't know what utilities I should be running with it, for commands like ls, cp, mv. I'm using Allan Pratt's utilities right now, are they ok then?

2. When I start up a shell with BGACC.ACC, whats the proper way of killing the shell window? Cntrl-D puts it into a "zombie" state, and then I can't due anything with it.

Other than that, I think its pretty amazing!! Last night I had a shell window up, copying a 400K file from floppy to the hard drive. It was really need being able to do this and still be able to do other things, including unarcing programs and the like.

(Eric, any chance of putting some sort of GDOS into the windows so there will be a wider selection of fonts to use? Or at least a way to change the default font size? BTW, keep up the good work!!)

Later.......

Yeah, Elvis is great, but I cannot ":set lines=30" to make it use the
full overscan resolution... this makes it useless to me, and this is
the only reason why my main ST editor still is Micro-Emacs, although
I'd really prefer vi.
Does anyone know where to get the sources of Elvis?

> Don't forget STevie.

Stevie allows to set the # of lines, but cursor keys don't work in insert
mode...

>tasks, though. I still have not seen a case where a GFA program is in
>the same league as properly written C code.

All in all, a well written, intelligent argument, Steve. I agree with you that the Explorer comparison appeared biased in favor of GFA, and that the C benchmark was evidently not written to take full advantage of the C compiler. That's wrong, and you did a good job of bringing that to light. In most cases a "correct" C program should be expected to edge out a "correct" GFA program in terms of sheer execution speed (but not by much, mind you) and smaller programs will be much more efficient, size wise, compared to a GFA version.

I also concede that for very large programming efforts, I would prefer a more modular language like C which gave me more control, var typing, debuggers, etc. But for other not quite so monstrous applications (say <10,000 lines?), the current version of GFA is _more_ than up to the task. Really.

But, once a program is compiled, how do you know whether it was derived from C or GFA (without close scrutiny with a disassembler). If so, how can you say you have never seen a GFA program in the same league as a C one? There are more than a few commercial applications out there (some good, some bad... just like C) that were written in GFA, you know.

You said you don't own GFA and that's OK, but perhaps you don't have first hand knowledge of using it either. I am familiar with both; I use C and C++ at work (Think C on the Mac <great> and Object Center on the Suns <arghh>) but I still prefer Atari software development with GFA (those are _my_ personal preferences, of course; your mileage may differ). I simply find that my development time is greatly shortened under GFA's interpreted environment. Granted, if I was an Atari C expert, the curve wouldn't be quite so steep.

Again, no flames and no arguments intended. I'm glad you shed some light on the Explorer article. I just didn't want other users to consider GFA in the realm of all those "other" BASICs. It's in a different class altogether and deserves the same respect of any other serious, capable programming language. Just because it is easy to use does not mean it is underpowered. For many users it offers just the right blend of power and capability, without the overhead of complexity many users find with C.

I have an original atari 520ST with RGB color monitor and single-sided
disk -drive. The monitor and drive work perfectly. The computer usually works
but is a bit unpredictable (like maybe loose chips or something, and occasionally
crashes. TOS on ROM in computer.

I would like to get $189.00 for the equipment.

After all this talk, nobody caught the fact that the 6502 is NOT a
motorola product but was built by Mostek, same people who designed
the 68901 MFP.

Hit a nerve have we? Oooooo. NNNNNAAAAASSSSTTTTY.

Just for the record. I would never ever work for Microsoft. I am actually disappointed that Darek does.

Such large corporations/organizations kill the market place, and produce substandard software products. Thats something we live with day to day.

And besides that, no man, women or child desrves to have the tremendous amounts of money bill gates has.

If I ever start a company, everyone is going to be paid by how much work they get done, and how much we all profit from our team work will be split equally. If you want merit increases, you form your own project work.

Mr. Gates and others like him better hope the Japanese and Europeans don't all of a sudden get smart and apply the same principles in manufacturing to software design...

Or we can kiss that home grown leading edge industry good bye too.

Put it quite frankly, you couldn't pay me enough to work for Micro-Dick.

>by 1280bytes. The slight problem is that as the screen drifts thru memory
>you eventually run out of memory. There are several ways of handling this.

> [two doubtful ways]

I have no idea how Eric did it (I haven't even seen it). But let me point
out an obvious technique:

1. Have a screen RAM area 25+n lines long.
2. When on the 25th line and a "scroll-up" is required,
simply adjust the screen pointer (as suggested).
3. When on the 25+nth line and a "scroll-up" is required,
do what is normally done (move 32K), but move it back
(n+1)*1280 bytes, rather than the usual 1280.

The effect of this is that "scroll-up" is effectively buffered, and since
it takes the same amount of time (your still only moving 32K, just further,
which matters not).

Someone mentioned that the screen seems to "jump" in blocks of 5. Let me
suggest that n=4.

Yeah. I disassembled the OS by hand, and it had some major design flaws.
The 16-bit TMS9900 was wasted because programs were written in an interpreted
"GPL" language stored in video RAM and on carts. This GPL was an 8-bit
language read through a memory-mapped porthole into a GROM or GRAM and
interpreted by a very advanced 16-bit CPU.

Unlike the Atari 8-bits, there were no hardware sprites either (I was soo
disappointed when I first upgraded to an ST 'cos I wanted to play with
hardware sprites. I still haven't to this day.).

BASIC programs were stored in VRAM, which was accessed via an 8-bit
memory-mapped address. BASIC programs were interpreted in GPL, which was
really just a jump table and a set of ROM routines stored in GROM, which was
(you guessed it) accessed through an 8-bit memory-mapped address. GPL itself
was executed by the 16-bit TMS9900 CPU. Fond memories are still brought back
whenever I see phrases like

BLWP @GREAD

spraypainted on a wall somewhere.

>
>Anyone else who remembers it, please correct me if I've got anything wrong.

Nope. The only thing you didn't mention was that it was 1/4 the price of an
Atari 8-bit by the time I could afford one (but of course, you didn't know
that).

>>I just a Mega STe and ran into a serious problem....
>>Whenever I try to run ANY program (so far...) I get 3 bombs in the
>>left side of the screen and the computer freezes. Does anyone have any
>>ideas ? This is very annoying %-). Could it be my hard disk driver ?
>>It's version 5.2.0 from ICD..... is that too old ??

I forgot to mention that Yes, I DO have an ICD controller - so there
is a good reason why I'm using ICD software (several pple asked..).

>If I boot from a floppy & THEN run ICDBOOT (did I mention that
>programs work fine from a floppy if the HD driver is NOT loaded ?)
>[assuming I can get to this step] I can access my hard drive just
>fine...

I now have a (very) kludgy solution to my problems..... I have a
floppy wih my ACC's &CPX's and auto folder & NEWDESK.INF.

I also have ICDBOOT.PRG as my autoboot program..... ugly, but it
works.

>I haven't tried the Atari hard drive utilities yet... maybe that'll
>fix the problem. But I would rather NOT have to reformat if possible.

The Atari hard drive utilities didn't work (even worse actually....,
at least the ICD driver let me see past partition E, which the atari
wouldn't)

Haven't reformatted & don't really want to.....

I'd like to thank all those who gave me wonderful suggestions & food
for thought.

:-).

4168. Adjusting SM124 black level(?)

Newsgroup: comp.sys.atari.st
Date: 1992-04-24 02:29:29 UTC
From: oddjob@oz.plymouth.edu
Message-ID: <1992Apr24.022929.6703@oz.plymouth.edu>
Source record: 223148

I could use some help w/a small problem (again? Yup %-).

I have an SM124 that is my primary monitor..... when I plug it into my Mega STe the "black level" (I think that's what it's called...) is much to high. It's TOO black..... drowns out everything except white.

My SM124 (circa. 1986) has a loose connector but it was NEVER this bad w/my old (& now defunct) 1040ST.

Is there any way to adjust the black level/intensity other than the two knobs on the outside of the monitor ? While it's usable, it's not great...

Thanx....

-Andy-

4170. Comments on my Mega STe

Newsgroup: comp.sys.atari.st
Date: 1992-04-24 02:42:27 UTC
From: oddjob@oz.plymouth.edu
Message-ID: <1992Apr24.024227.7368@oz.plymouth.edu>
Source record: 223150

I wouldn't want anyone to get the wrong impression from my previous messages about problems I'm having with my new Mega STe.

I like the machine VERY much.. !!!! A real (finally) computer from Atari. The speed is great, most of the programs I've tried work, it looks 'different', and the keyboard is (IMHO) the best yet. It even beats out the two keyboards I've liked on other machines (Apple Extended KB & IBM DisplayWriter (circa 1981)).

All I need now is LocalTalk using the LAN port & I could die happy.

I do have another question though..... does serial port 2 use the VME bus or just the access panel to it ?

4175. GFA Developers wanted ! urgent !

Newsgroup: comp.sys.atari.st
Date: 1992-04-24 09:28:47 UTC

Message-ID: <1992Apr24.092847.2834@informatik.uni-erlangen.de>
Source record: 223055

Hi all there !

I just saw the (old) discussion about C and GFA. (seems like neverending Story.:)

But I don't want to participate on that. All I need are competent GFA Developers. We are a small company of 3 people and mainly working on MIDI Applications and Fantasy-Games. All Programms have to run on all Resolutions (640 x 200 upward) and on all ST/STE/TT Machines. We use 3.6TT D, Interface, ergo! and some Tools on our TT's.

If there are developers with abilities and interest, they should contact me.

Ciao
Atarico

PS: One word to the C<->GFA discussion: (can't stop my fingers)

I learned GFA 1.0 .
Then I got experience with 2.0,3.0 and 3.6 .
Then I learned C (on VAX).
All I can say is, that C is a language you can write Programms in. And it is a very popular language you can find on (almost) every machine. BUT: GFA is not on VAX implemented. (Thats bad, because VAX-C is MUCH WORSE than ATARI-GFA).

All I want to say is: I use GFA where I can, and if theres no implementation, I have to use C.

4176. Atari ST jpeg3.0 about to be 'served'

Newsgroup: comp.sys.atari.st

Hi!

Me and my friend TC are proud to state : the Jpeg package V3.0 has been
compiled on the ST , error-free.
The new version is said to be speed-improved and finally features
'well-dithered' output in GIF-format.

After i have done some testing, i will post the new version if there is any
interest.

One last Question : wold you like
a) unix-style commandline - Format ("djpeg -G a.jpg >a.gif")
- nice for usage within a pipe, but not supported by every shell
b) DOS/MAC-like TWO_FILE_COMMANDLINE ("djpeg -G a.jpg a.gif")
- easier if you want to use it as a .TTP from the desktop

Bye,
Frank

>
>I'd like to know if some of my current AUTO file programs won't be
>necessary now (Pinhead, Fatspeed, FolderXXX), and what patch programs
>people have found useful to fix bugs in TOS 1.4.

You won't need Pinhead or FATspeed any more. You may need FOLDERxxx,
depending on what you do... TOS 1.4 is much better at handling its internal
OS pool memory, so the 40 folder bug no longer exists. It is still possible
to run out of OS pool, though, if you have a _lot_ of files open and/or a _lot_
of Malloced memory blocks.

New patch programs required are POOLFIX3 (to fix a problem introduced into
the OS pool memory manager), TOS14FIX to sort a few obscure bugs, and
TURBOCTS or similar if you intend to use RTS/CTS handshaking on the serial
port.

Both please - just check the number of filenames you have. if its only
one then send to stdout, if its 2 then send to the second one. (and if
none then stdin to stdout would be nice...). Should be easy enough to
do except for the last one (I dont knoew if djpeg fseeks on its input).

In response to cbbrowne@csi.uottawa.ca (Christopher Browne)'s posting:

>Not plausible.

Yes it is... and here's how (Instructions after the -cut here- line).

>*bits cut*
>
>And it is the ABSOLUTE minimum. You'd need to put the input/output
>files on a RAMdisk, and with only 1MB, you don't have room for that.
>

True, TeX needs all of the 1 Meg for program/workspace.

>Plus, this would NOT run LaTeX - which is assumed for a lot of the stuff
>you'd get.

Most people just want to process small documents (I say small but 100
or so pages are possible in 1 Meg, with a table of contents too!)
These people don't (or shouldn't) require BiBTeX or METAfont,
and so you can get by WITHOUT a hard drive, with a little disk
swapping, depending on how many drives you have.

>It MAY be possible to run a stripped-down TeX which only has a couple of
>fonts (which means: no math), but I wouldn't want to try it.
>
>Oh right, you also would need to have some sort of shell, in order to
>set up the environment variables. It costs you some combination of
>RAM and disk space.
```

>
>It ain't gonna work.

You get TeX, LaTeX, Screen Previewer and Printer drivers, all run
from the CS-TEX shell. The editor is MicroEmacs (and a good one it
is too!) but you could use whichever editor you prefer, if it fits
on the disk.

>If you had a hard drive, then there would be NO problem. (Indeed, the
>package CS-TeX for the ST is better in my experience than many of the
>versions for other computers. And it's free, to boot.)

\hsmiley
No need for the hard drive.... read on and good luck!

The following is a document I was working on, but I have
had too much university work on lately in order to finish it.
!!! PLEASE NOTE THAT IT IS BY NO MEANS COMPLETE, JUST USABLE !!!
The document has, however, been used by other net people successfully,
as a kind of beta-test, and as there seems a call for such a document,
I'm posting it as I won't have time to complete it until after my finals
(mid-June). The set-up was derived by myself before Christmas('91) by
extracting the bits that I thought were relevent from the CS-TEX files.
I have been using it with no problems since then (except for the printer
driver, but that's fixed now). Older ST owners may experience problems
(caused by either the Atari Fileselector or the shell - authors please
note!) but a few friends have managed to get by somehow, so that'll be
included in the final document. To reserve a copy, just send me you're
email address with a short request and I'll send the file to you when it's
complete. Alternatively, I'll simply post it to comp.sys.atari.st.

If you spot any errors please report them to me. Also, send me any
suggestions you may have for enhancements, and you will be credited
in the final document.

------------------------------ cut here ------------------------------

SETTING-UP

You will need the following files, available from both:

atari.archive.umich.edu [141.211.164.8] in the atari/tex/cs-tex
directory and somwhere in rusinfo.rus.uni-stuttgart.de [129.69.1.12].

Un-zoo these to eight seperate disks and name them as follows:
(Note: You need version 2.1 above, in order to extract these.
It can be a pain too, you may need to format disks to 82 tracks,
10 sectors in order to squeeze the stuff on. Also, using zoo in
1 Meg with large files can be tricky. I found it's best to use a
ramdisk to hold the .zoo file, zoo.ttp and a zoo-shell, and then
to extract onto the disk, a few files at a time if necessary.)

CS-tex-1 TeX 1
CS-tex-2 TeX 2
CS-tex-3 TeX 3
CS-tex-4 TeX 4
CS-fonts1 Fonts 1
CS-fonts2 Fonts 2

Now prepare 4 blanks disks formatted to 80 tracks, 10 sectors per track.
(I suggest using 'FcopyIII' for this, and to format the disk twice, just
to make sure, but it's up to you.)

Label one blank disk 'Disk B - Documents', and extract the following
files from the disk 'TeX 1' into the root directory:
(I used the program 'unlzh172.prg' with the options 'extract to
directory' and 'overwrite existing files' both set to 'NO')

INPUTS.LZH - extracts to a directory called INPUTS
STYLES.LZH - becomes the directory STYLES, which
contains a directory LOCAL.
TFM.LZH - becomes the directory TFM.
DEMO.LZH - become the directory DEMO, rename this
to TEX_DOCS

Put this 'Disk B' aside, label a fresh disk 'Disk A - TeX Binaries'.
Still from 'TeX 1', extract the following:

TEX31.LZH - extract only the files CTEX_E.PRG, TEX.POO
and TEX.TTP. These are put into a directory
TEX31, TEX.POO into a folder FORMATS and
TEX.TTP into a directory BIN. Copy the contents
of the TEX31 directory into the root directory,
and then delete the whole folder TEX31.

From the disk 'TeX 4', extract the file M_EMACS.LZH into the
root directory. This produces files in the BIN directory, and
a also a new directory. Delete this second directory as we need
the disk space!

In order to use the TeX and LaTeX system, the files PLAIN.FMT
and LATEX.FMT must be present in the FORMATS directory.
The generation of .FMT files was a real pain, and I wouldn't
advise anyone to go though it without a hard-drive. I doubt
that I could emulate the method I used to generate the two
initially! For just normal work though, these files are
sufficient, so I'll either e-mail them to you, or get them
uploaded to the atari.archive (if I can work out how!) as,
unfortuantely, they're not included in any of the original disks.
Alternatively, beg for them off a friend!

So that's the binaries disk complete, just to check, here's a
complete directory listing:

\BIN -> TEXIN.CMD
TEXOUT.CMD

EMACS.HLP
EMACS.RC
ME.TTP
TEX.TTP
ME_DOC.TXT
\FORMATS -> LATEX.FMT
PLAIN.FMT
TEX.POO
\CTEX_E.PRG

Get another blank disk and mark it 'Screen Previewer'.

The screen previewer is created from the following:
From the disk 'TeX 3', extract the file 'PREVIEW.LZH' to
the fresh disk. Next, add the fonts from the file 'FONTS.LZH'
found on the disk 'Fonts 1'. This is all you need for the
previewer disk.

Now mark the final blank disk 'Printer Driver(s)'.

This will be used to house both the 9 and 24 pin printer drivers.
Extract from the disk 'TeX 3' the file IMPACTS.LZH. This creates
a directory BIN in which the two files DVI_N9.TTP and DVI_N24.TTP
are put. To the same disk, extract the files FX_MINI.LZH and
P6_FONTS.LZH from the disk 'Fonts 1'. These set up the font
directories and sub-directories for use by both the drivers.

Deskjet and Laser printer owners (lucky people!) should use the
drivers found in OTHER.LZH and LASER.LZH on 'TeX 3' plus the fonts
in LJ_FONTS.LZH on the disk 'Fonts 2', although Deskjets may use the
P6_FONTS. I haven't been able to test this out myself.

SETTING UP THE SHELL

Turn the ST off, and insert the 'TeX Binaries' disk into drive A.
(If you have 2 drives, put the 'Documents' disk into the second drive)
Now switch on and go to medium resolution (if your not using a b/w monitor)
and save a DESKTOP.INF with a layout your happy with, so that you'll be
able to run CTEX_E.PRG whenever you boot the disk. STE owners can
use the 'Install Application' to make CTEX_E.PRG auto-running,
but it can't be put into an AUTO folder as it uses GEM.
Remember to save the desktop AFTER installing the program.

Now you're ready to run CTEX_E.PRG

You'll be greeted with a menu bar from which select the Parameters menu.
First, turn off the direct preview option. Next, select the Environment
option and change the following defaults:

Name Default Change to

TEXINPUTS .;a:\tex\inputs* .;b:\inputs*
a:\tex\styles* b:\styles*

```
TEXFORMATS a:\tex\formats a:\formats
TEXFONTS a:\tex\tfm\* b:\tfm\*
TEXBIB I haven't bothered with this!

Select 'OK' to confirm these changes.

From the Find menu, select the Editor option. Locate the editor ME.TTP
(It has the path A:\BIN\ME.TTP). Do the same for TeX, locating TEX.TTP.

After that, select the option 'Main File'. We want to locate the
directory in which our .TEX files will be situated. On a
two drive system this is no problem, and using an STE with one
drive, I have had no problems. But a problem arises on older ST[F]M's.
Try the following:

Set the PATH to B:\TEX_DOCS\*.TEX
and the SELECTION to <blank>

Click the grey bar to the right of the 'close directory' square,
and the machine should respond with the directory listing.
If you have only one drive, you'll be asked to 'Insert disk B',
as normal, so put the 'Documents' disk in the drive, and you'll
get the directory. What happens on the older ST's is that they
crash! This is either due to the older TOS, or the shell itself.
I'm trying to get around it, but have had no luck so far, so if
anyone else does find a way, let me know.

With the directory located, choose 'OK', even though no file is
located. This is done so that every time you boot CTEX, it knows
where to look for your files. (Single drive owners will get asked
to 'Insert disk B' just after CTEX loads, this is normal)

To find the previewer, put the 'Screen Previewer' disk into the drive,
and then locate it. It will have the path A:\BIN\DVI_VIEW.TTP (for
single drive owners this will involve another disk swap after being
asked to place disk A in drive A.) What we are doing is fooling the
shell into thinking that all the binaries are in one place, I'll
explain how this is exploited in the next section.

Do the same thing with your 'Printer Driver(s)' disk. Locate DVI_N9.TTP
as 'Printer 1' and DVI_N24.TTP as 'Printer 2'. After that, select the
'Printer' option within the 'Parameter' menu (or simply press 'Z').
Change the options to read:

Screen : -p=a4
Printer 1 : -p=a4 -y=eps -z
Printer 2 : -p=a4 -y=eps -z -v=180
(Clear printers 3 and 4 if you wish)

The -y option sets the driver to the type of printer you have.
For the 9-pin driver, you can use 'eps', 'star' and 'tax' for either
Epson FX-80, Star Gemini-10x or Taxan KP-810 printers respectively.
The 24-pin driver supports 'eps', 'nec' and 'oki' for Epson LQ-850,
```

NEC P6 and OKI ML-390 printers respectively.
Change the -y setting to best reflect the printer you own, i.e. the
driver most compatable (usually suggested in your printer manual.)
e.g. my Star prefers Epson LQ-800 emulation, hence I use -y=eps.
To continue, select 'OK' to confirm these settings.

To retain the whole setup, choose the 'Save' option within the
'Parameters' menu. Save the file CTEX.INF to the root directory
of the 'TeX Binaries' disk.

Your now ready to test the system.

PROCESSING .TEX FILES

To start off with, locate your main file. A short cut to do this
is to press 'H', after which you'll get the directory of TEX_DOCS.
For our test, select the document DEMO.TEX.

To test the editor, press the 'E' key (or use the 'Work' menu option)
and Emacs will load, with the file DEMO.TEX. (Single drive owners note:
when the machine asks for Disk A or Disk B, these corrispond to the
'TeX Binaries' disk and the 'Documents' disk respectively, and you should
swap them accordingly.) Unfortunately the text is in German, but nether
the less, this is just a test!

Delete the 'g' after the words '%format latexg' on line one, as
our setup has only the LATEX.FMT file present, and not the file
LATEXG.FMT, german version.
Now save the text using '^x^s' and then exit using '^x^c'.
You'll then be returned to the shell.
(Yes, I do know that 'ESCz' is a short cut to save and quit!)

Select 'Tex' from the 'Work' menu (or just press 'T') to process
the .TEX file into a .DVI file (with a .LOG and .AUX file also
being created). There shouldn't be any errors, just a bit of disk
swapping for single drive owners (invest in a second drive, it's
worth every penny!)

When that's complete, you're returned to the shell.
Now come the part to fool the system.. take note!

Dual drive owners:
Whilst in the shell, swap disk A for the 'Preview' disk.
You can now press 'V' and the viewer will load and run,
and you'll see the output of DEMO.TEX, pressing the HELP
key will show you the options of the viewer, when your
bored, press ESC to return to the shell.

Single drive owners:
If you've just processed a document, disk B will be in
the drive. When you press 'V' then, you'll be asked to
put disk A back into the drive. Instead of putting the

'Binaries' disk in, put the 'Screen Previewer' disk in.
Hopefully, all will run as described above, only a couple
of disk swaps will take place as the fonts are loaded.

In order to print the document, you follow the same procedure
described above, only with the 'Printer Driver' disk instead
of the 'Screen Previewer' disk. Simple eh?!?

And that's basically all there is to it, any problems - no doubt
you'll be in touch.

Enjoy,
Mark.

4184. Solved. (Was: Mark William's C fseek() problem?)

Newsgroup: comp.sys.atari.st
Date: 1992-04-24 14:54:13 UTC
From: CADS_COLE@GALLUA.BITNET
Message-ID: <1992Apr24.095413.1@gallua>
Source record: 223064
Cross-posted to: comp.sys.atari.st.tech,comp.sys.atari.st,comp.lang.c

As pointed out by several people on these lists, the problem was not with my fseek, but with my fread that followed it. If anything, the bug is an inconsistency between Mark William's C's ftell and fread. ftell is defined as returning a long, yet fread expects an int. So, when I fed fread a long dumpsize (as returned by ftell), everything went haywire.

Thanx all.

While I am currently enjoying Calamus SL, I am having some problems with printing on my Deskjet 500. It is REALLY SLOW. I mean it. It is AT LEAST 10 times as slow as 1.09n. Any ideas?

Here is something interesting that I thought I would share with you... In the 1992 Popular Electronics _Electronics Hobbyists Handbook_, there is an advertisement for NRI schools. YOu know these people, they are a correspondance school, and have stuff like "TV and VCR Repair", etc. Anyways. The ad says stuff like this:

...with the equipment thats revolutionizing the music industry - the Atari ST series computer...

..with its tremendous power, superior graphics...and built in MIDI...

etc...

Kinda nice too see something like that :)

That's APX (Atari Program Exchange), and I believe Douglas Crockford did them.
Crockford is now at Skywalker Ranch for Lucasfilms.

> Could you tell some of us less informed about jpg (sic)?

I suppose you meant jpeg?

Jpeg is a relatively new standard for color image compression. It has two forms: lossy and non-lossy. Lossy compression causes some about of image information loss, and non-lossy does not. The standard takes into account "continuous" image data and large color images (like 24 bit color). The lossy algorithm can be (and has been) done in hardward already. And, PostScript Level 2 knows about jpeg also.

I have the first standard publication thanks to Adobe - if you really want more info, let me know.

Have fun! - Bob

How about
jpeg [-G] [file1 [file2]]

-G (I have no idea what this really is) is an optional mode. If not
specified a small helpscreen will appear on stdout, an error code will
be returned to (hummm... stderr?)...

File one is optional input file, if at least one filename is not specified
input will be from stdin.

File two is optional output file, if two filenames are not specified,
output goes to stdout.

Sorry... just my two cents worth!

Basic as a programming language sucks. Period.

Quality applications resulting from its use doesn't justify its incredible vast array of weaknesses.

Basic originated at Dartmouth college by a bunch of academically inclined weenies who had nothing better to do with thier time but set back software design clock by about 30 years or so.

BASIC....Bad And Sick Imbecile Code.

I hope I never have that much time on my hands as to think about a new language as bad as BASIC.

>

Do you plan on making money with this company?

Obviously not. Anthing you can write in BASIC, I can write in C, but
my program will be:

1) Far more effective in handling the machines memory resources.

2) Performance won't even be comparable. C kicks but boy.

3) Pick any platform to run my program on. Localize machine specific features
for a wide variety of machines (software markets) (MORE MONEY MORE MONEY..).

4) Much better software development tools. (Less bugs)

In short, you won't make any money, to spend all that time writing your BASIC program.

Look, either change or DIE. Its time to dump GFA and become a competent C programmer. The ST is too dinky of a computer to restrict yourself like that...your also missing out on some really good opportunities to program better hardware....ie MIPS 4000 machines, HP's Latest workstations...

I have to agree with Bob Malay, and add in my own personal point of view. I just read two different PC magazines featuring OS/2. What does it require for hardware? A 386SX or DX, about 4-6MB RAM, and at least 15MB of harddrive space. Windows NT will require a 386 as well. Now if Darek's computers are 286 machines, then what he says about his computer being "obsolete" in a couple years is false, if one relates obsolescence with not being able to run the latest and greatest. It's already common for PC magazine columnists to call 286 machines Labotomized... to me that equates to me thinking they view 286 machines as slipping down into the pit of obsolescence.

|> c:\bin\gcc-cpp.ttp -lang-c++ -v -undef .....................
|> GNU CPP-atariST version 2.1 Patchlevel 1
|> cc1plus c:/tmp/cc100000.i ..............................
|>
|> cmd exit code 1
|>
```

What happens here?

I had the same problems with even gcc 2.1 until I removed a desc acc.
called Harlekin (I don't know if you know it). Now all works fine,
gcc and g++.

If you look at your posting you can see that CPP caused the exit(1)
and not gcc-cc1+ (that's the originally right name for it, if you
want to change it set up your environments).
Try g++ with the -v -E options to see how the prepocessor runs.

How much memory is installed? I use 2 Meg's (but cout << "..." fails).
May be gcc checks your memory before it runs gcc-cc1+ .

Remove all installed acc's and even auto folder prg's, then you can be
sure there's no dirty program that manipulates your system variables.

Please send me a mail when g++ runs ok. Good luck, ap.

4199. Falcon (game) run from Hard Drive?

Newsgroup: comp.sys.atari.st
Date: 1992-04-24 20:06:52 UTC
From: friedric@mdd.comm.mot.com
Message-ID: <1992Apr24.200652.10932@mdd.comm.mot.com>
Source record: 223079

Anybody out there able to run Falcon v1.2, the flight simulator
game from their hardrive?

I've got a a Toad HD with 52M Quantum and ICD Advantage + host adaptor,
and v5.5 boot software.

I ran the install routine from the Falcon floppies, then tried to
run the program from the hard drive. The copy protection screen
(type in from codewheel) comes on, I enter the correct code,
and boom! 3 bombs.

If I try to run the program from the floppy, with the hard drive on,
the program initilization screen comes up, but the program never loads.
The floppy just keeps spinning. So it's not the HD loader program.

If I turn off the hard drive and run from floppy, the program works just
dandy. So it's not corrupted disks.

What's goin on?, neither ICD of Spectrum Holobyte could help.

Any help would be appreciated.
Thanks,
Bernd

Wrong. There are versions of BASIC available which are as structured as C, Pascal or any other language you care to mention. The only difference between these languages and a properly structured BASIC (e.g. GFA or HiSoft) is BASIC's lack of user-definable data types.

Not to bring a dark cloud on MiNT, which I think is a great piece of
work, but what is going to happen when MTOS hits the street this summer?
It seems to promise the things that MiNT lacks (mainly MultiGEM and VM
support on a '030), and would also be supported by Atari....
I would hate to see MiNT go, but I guess it it up to the masses
to keep up with MTOS....
Ziggy.

Well, I have a 240 quantum SCSI drive, does the same thing,
but the timing is variable.
Maybe it's flushing the write buffers to disk, or doing some
other kind of routine maintenance.
Our SUN does all kinds of stuff when nobody is working on it.

>are unarced they become slightly too much to fit on one floppy.

Yes. I've been formatting my disks 82 tracks, 10 sectors since 1988, when
I got my first ST. I've never had a problem with them, and I use generic
MEI Micro disks. I've had three STs, a 1040STf, 1040STE, and now a MegaSTE, and the disks
worked on all of them.

> I also would appreciate any help with cybscape.lzh, I haven't
>got it to do much of anything yet.

How far have you gotten? Be sure to extract everything to a floppy and boot
your computer from that floppy. Be sure you have at least a meg of RAM. It
will take a while to load all the modules in CyberScape, but it's worth it.

>It ran at 3.3 MHz, but the registers were in video ram, not on the processor.

Most certainly not. The registers were in RAM memory, not VRAM, because the CPU had to access them directly (as offsets from the WP register).

>>It had a 16-bit processor, but very little memory (I forget exactly how

VRAM could not be expanded beyond 16K. Processor RAM could be expanded to 48K, but the limitation was due to the fact that you could expand only through a special "expansion box", which had a limited number of slots.

>>You had to buy a ridiculously expensive disk system before you could do any

>an Extended BASIC cartridge gave you limited PEEKs and POKEs (can't remember
>how) and access to 28 or 32 one-color sprites (nice).

The assembler was written in assembler, and was blindingly fast. Unfortunately, it was a line-by-line assembler, so you couldn't edit what you had typed in. BASIC was executed from VRAM, Extended BASIC was executed from processor RAM so was much faster.

There were actually an unlimited number of sprites (when accessed from assembler), but they were not hardware sprites. Much like the ST.

Does anyone know of a magazine exclussively for the ST's?
I called J&R music world and they told me that the ST is out of style,
is this true or do you think he was just trying to get me to buy a more
expensive computer.

Were the problems associated with ST cache programs or PC cache programs running under ATspeed? Soeer I can't answer your question, but as a new ATspeed owner, I'd like to learn more about the problem.

>as bad as BASIC.
>

Greg, this is a pretty weak argument you are relying on, what exactly are the weaknesses you are mentioning? Personally insulting the designers is not generally a valid argument. In addition, it seems you have been out of touch with some of the newer BASIC programs. I can write a GFA BASIC program which is just as readable and structured as your magnificent C code. GFA has full implementation of procedures with variable parameters, all the standard structured loops, variable typing, etc... As mentioned in a previous post the main thing missing is the ability to define your own variables (i.e. structures and type ranges).

I could construct an argument similar to yours, comparing C to ADA and come to the conclusion that C is a weakened, sloppy, and error-prone language which should be shot. However, I believe this is a bit extreme, but I don't think just because most people program in C elevates it to deity status by any means, it has advantages and disadvantages just like any programming language.

And let's PLEASE not start a flame war about "my programming language is better than yours," that is obviously ridiculous.

4211. LAN port on TT/Mega STe

Newsgroup: comp.sys.atari.st
Date: 1992-04-25 03:09:39 UTC
From: oddjob@oz.plymouth.edu
Message-ID: <1992Apr25.030939.477@oz.plymouth.edu>
Source record: 223091

Does anyone have plans for the LAN port on the Mega STe & the TT ? I'd be very interested in a PD Appletalk implementation that uses it..... and I'm sure there are other pple who would like it also....

For anyone who is interested in tackling this..... have you heard about CAP (the Columbia Appletalk Package). It's a collection of programs for Unix type machines that allows them to communicate w/Appletalk devices using Ethernet bridges such as the Cayman GatorBox, Shiva FastPath, etc. It'd be a great starting point......

The curious can find CAP 6.0 on gatekeeper.dec.com in the directory /pub/net/appletalk/cap as a 1.3meg compressed tar file.

I'm not volunteering myself for this..... besides not having the competence to tackle it I've already got my plate full looking for a Real[tm] job and other fun projects... But I'd be willing to help beta test such a beast (in the fall when I get my hands on a Mac).

Date: 1992-04-25 05:40:35 UTC
From: rickhall@bruno.cs.colorado.edu
Message-ID: <1992Apr25.054035.8977@colorado.edu>
Source record: 223092
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I am in the market for and engagement ring and I am in
desparate need of money. If you are interested in
upgrading your system or buying a TT, make me an offer
on my TT, I might be desperate enough to take it...

TT030 Computer w/ 4MB ST RAM
50MB internal hard drive
PTC1426 color monitor
Cordless mouse
2400 Baud Supra Modem
any pd software on my harddrive...

All for the low asking price of $2100obo (excluding shipping).

Besides the above, you get all the other TT features like VME, LAN,
multiple serial ports, higher rez, etc.

Thanks,

Richard Hall

4213. SST on STe?

Newsgroup: comp.sys.atari.st
Date: 1992-04-25 06:03:20 UTC
From: ec333way@steam.uwaterloo.ca
Message-ID: <1992Apr25.060320.22801@watserv1.waterloo.edu>
Source record: 223093
Cross-posted to: comp.sys.atari.st.tech,comp.sys.atari.st

Sorry if this is a repost - NOTE it's been modified (I added to it).

Just a quick question - the SST works on the mega's, I know.. How about the
mega STe's?? Do the mega STe's also have the internal bus slot for the
megatalk board?? Does spectre GCR have any problem with STe's?
Also, does the icd host adapter for the mega series interfere with the
megatalk board?
I think the answers should be yes,yes,no,no BUT I'm just covering all bases..

Thanks,

1) As far as I know the SST does not work on any STe currently, just on normal ST's and Megas (someone help me here -- I know the TinyTurbo 030 works on all ST's, is the SST just for the Mega ST?)

2) The Mega STe's and the TT both have a VME bus which allows the addition of networking, graphics, other standard cards with the appropriate software to match it. I assume when Dave gets the Megatalk in production that the Mega STe version will be VME bus, this is the most logical way to do it -- also, you should be able to find VME networking cards not Atari specific, problem now is the software to drive the thing. If you are saying does the Mega STe have the same bus as the Mega ST, the answer is no, it doesn't. However, like I said, it has VME which is even better. :-)

3) I am 99.9% sure Spectre GCR has no problems with the Mega STe's, as I have been to two different dealers where they had a Mega STe with a Spectre GCR cartridge plugged into it, working just great (it really speeds along with the 16MHz and the cache enabled), they had a SLM804 hooked up too so I don't think there are any problems.

4) I have no idea, I'm still a lame floppy user with TOS 1.0 (soon to be TT030 I hope when I get out of school), so I have no idea how the ICD adapter will interfere or connect to the Megatalk board.

So, it looks like the answers are no,yes,yes,and who knows????

From memory there is one adjustment called sub bright VR 702, this pot is very sensitive, so turn carefully...

kllove@uokmax.ecn.uoknor.edu (Kenneth L Love) writes:
:
: My question is pretty simple: Does dbMAN V ver. 5.2 (higher?) support
: the use of arrays? If it doesn't then I won't bother with it. In
: which case, I would have to purchase an IBM compat. laptop to do work
: on. :(

dBMAN version 5.3 does support arrays.

: Does somebody know an address and/or telephone # for the makers of dbMAN?

VersaSoft Corporation
P.O. Box 36078
San Jose, CA 95158

Phone: (408)723-9044 Fax: (408)723-9046

: ... What does dbMAN's compiler do? Create *.obj files
: for a linker or create an executable file or some intermediate form such
: as d-Code?

It creates *.run files, one file per source module. I think it is
compiled into some sort of intermediate form.

I should also mention that dBMAN is available on a large number of
platforms besides the Atari ST.

!
!>BTW: Your GEM_Init code is just the normal way of installing and initalizing a
!>virtual graphic workstation. This should only be done when you're running as a
!>.PRG or .APP, otherwise the machine will crash. The same applies of course to
!>the use of menus, dialogs and all the other GEM-stuff.
!
! Ummm, that's wrong. I quite frequently use VDI drawing and blitting in
!TOS and TTP programs, there's absolutely no reason why you shouldn't. For
!that matter, you can even use appl_init() followed by any other AES calls
!in a TOS or TPP program without crashing the system, but the mosue won't
!be active and there'll be no system desktop under your program so redraws
!will be a bit wrong. But it certainly doesn't crash the machine.

But this sounds quite dirty, because there is a way to start a shell
COMMAND.PRG before GEM/AES & VDI) is not installed (I.e starting a shell
instead of Gem.prg from mint.cnf !). In this case the Programm
will crash, due to some unsetted trap's (should at least trap #2)
What you might use is Linea in Your program (BTW this is dirty too).

Wolfgang

I've had two Seagate's that also do this. Are you using an ICD host adapter. It is my GUESS that it is the ICD software that causes this and not the hard disk, I also have the theory that it may be an attempt to avoid the "stiction" problem that some drives have (where the heads stick). I've seen software standalones (run from the auto folder) that are designed to prevent this problem and I assume it works by moving the head periodically. Sorry this is not a fact filled post, but look at it this way, if my info is untrue, there's bound to be an answer posted! In my 7 years on the net, I've found that the best way to generate follow-ups is to make a mistake in content, spelling or grammer :-)

Reiterating a point made by others: Mostek and MOS Technology are NOT
the same.
The 6502 was a MOS Technology processor.Mostek had nothing to do with it.

4229. new Mega-STE won't boot

Newsgroup: comp.sys.atari.st
Date: 1992-04-25 17:35:12 UTC
From: tapp@uvphys.phys.uvic.ca
Message-ID: <1992Apr26.004824.7499@sol.UVic.CA>
Source record: 222921

When I follow the instructions in the owner's manual and power on my new Mega2-STE with an SC1224 monitor, I hear the hard disk go through its power-up sequence, but all that appears on the screen is a set of vertical bars.

If I use an SM125 monitor, the screen remains dark.

If I insert a diskette and power it on while pressing the Alternate key, the indicator light on the floppy drive doesn't come on.

Both monitors work ok with my old 1040-STF.

Any suggestions what else I could try?

Thanks.

Bob Tapp.

It's an anti-stiction maneuver. It's in the ROMs of the SCSI controller
built into the hard drive. My N-series Seagate, plugged into a Supra
adaptor, periodically makes noises like a wet dog shaking itself dry. I
used to have an Adaptec controller and an ST-506-type Wren I plugged in,
and it didn't have that feature.

4235. MonSTer on a Mega STe ?

Newsgroup: comp.sys.atari.st
Date: 1992-04-25 21:28:27 UTC
From: oddjob@oz.plymouth.edu
Message-ID: <1992Apr25.212827.27661@oz.plymouth.edu>
Source record: 222914

Is there a version of MonSTer later than 0.3 that works on a Mega STe ? This version (which is the version currently on atari.archives does some rather funky things on mine. While the scrolling is great(!!) [4x the screen space of a stock ST mono screen, much faster than anything else I've ever seen) it is almost useless.

Why ? Because it changes the font sizes and anything else used by GEM (ie menu bars, windows, etc) to half its original size while GEM still thinks they are normal sized. Just a BIG mess.

I'd love to get a working version of this... not necessarily PD or Shareware.

4236. FORSALE: Atari ST 49 Meg Hard Drive

Newsgroup: comp.sys.atari.st
Date: 1992-04-25 21:59:11 UTC
From: scottshk@csd4.csd.uwm.edu
Message-ID: <1992Apr25.215911.8463@uwm.edu>
Source record: 222915
Cross-posted to: comp.sys.atari.st,wi.forsale,uwisc.forsale,misc.forsale.computers

I have a 49 Megabyte Atari ST hard disk for sale:

-shoebox case, power supply, fan
-host adaptor card built in
-DMA through for connecting multi hd's or laser printers
-all necessary cables
-room for another 1/2 ht drive (includes cables for this)
-3 1/2 " hard disk unit
-40ms access time
-very reliable
-includes quite a bit of hd software including:
format, compression, caching, etc.

PRICE: $275 w/o UPS COD shipping.
(or BEST OFFER)

Reason for selling: I don't use my Atari that much anymore.

Please send E-Mail offers if yer interested!

>bus or just the access panel to it ?

I haven't actually opened up the VME bus yet, but I've heard that serial port 2 is just connected to a cable that goes to the motherboard. So, it acts just like a cover, and doesn't use the VME bus.

There is software that already uses the LAN ports. Universal Network from A&D Software, or PowerNet from PowerPoint Software. I'd go with the latter however, as I doubt UN will no longer be upgraded. Chris Latham programmed UN and has since started his own company, PowerPoint Software.

One thing you should know however, is that the LAN port on the TT is DMA driven whereas it's not DMA driven on the Mega STE. I got this from Chris when I was writing my Mega STE review (hopefully to be published in the May issue of Atari Advantage :^). When the LAN is used on the Mega STE, the rest of the system shuts down. Chris says that the corner clocks, for example, even stop updating their displays.

Of course there is. Try Outside by Maxon or VRAM by <I_don't_know_who>.
If I remember tests correctly VRAM is a bit more powerful.
Both programs give you as much memory as your harddisk can provide.

Cheers, Paddy

That's the attitude to take, Marshall. Anybody else willing
to experiment...BE SURE YOU HAVE BACKED UP YOUR DISK! I
remember chewing up my disk several times before realizing
what was the cause of all my problems!

It's really too bad, you know...a decent cache could help
speed things up a bit.

Are you running it on a TT or MSTE/ST? Calamus SL is optimzed for TT,
and it has the fastest vector printer drivers available for TT...
How much memory does your Atari have?

Wrong. The 6502 was designed by MOS Technology which is a different company than the now defunct MosTek. MOS Technology is owned by Commodore. And the 68901 MFP is designed and made by Motorola not MosTek. Others have mentioned that the TI 99/4A used a Texas Instruments TMS9900 16 bit CPU.

Ok, I'm new to this group. I own several Atari-8bits and a few IBMs
(I really hate the IBMs) anyways....I want to get into the ST market.
So..what is the going price for used and new ste's and mege ste's and tt's
. Also, has anyone used the multitasking o/s thats out there for the
desktop. and.....what incompatibilites are there with these machines and
the original 520st. What should I look out for.

>that a PC is a superior product!

You hit it right on the head! The fact that 10 zillion people bought a PC only goes to show that there are at least 9 zillion people who didn't do any research before dropping their cash. If quality is defined by quantity, then we must assume that BETA is not as good as VHS...

Frankly, the only thing sure about DOSasaurus machines is that, if cars needed DOS to run you'd have to stand in front of the bumper and crank it to get it started every morning.

Even though you assume that 9 zillion of the users only are into DOS, you are forgetting the fact that PC platforms come in multiple OSs. DOS is just the most popular of them. I myself will be converting the OS to OS/2 2.00 shortly and later probably to the NeXT /Unix OS.
What is probably the superior machine is defined by the user's wants, not by popularity of how many machines are out there. I personally define my version of superiority (not for everyone) based on price, performance, , solving my needs, and support.

4249. Virtual Memory on the TT

4250. Terminal programs info wanted

Newsgroup: comp.sys.atari.st
Date: 1992-04-26 07:06:46 UTC
From: ehohnbau@Bonnie.ICS.UCI.EDU
Message-ID: <9204260006.aa15366@Bonnie.ics.uci.edu>
Source record: 222929

I am looking to buy a new terminal program and was considering
primarily Stalker and Stealth. I'd like people who use them to
email me with comments and recommendations.

I specifically am interested in:
Can Stealth be run as a DA like Stalker can?

What is the capture file mechanism of either/both?
Do they capture to memory and you then save or does it write to disk or
both?
What terminal types does Stealth emulate?
Does either support Kermit?

Thanx in advance
Eric Hohnbaum

Other remarks deleted which were pretty good...

*****
Seeing as I started this topic simply by asking the question, and the responses that some people put on here, I did a little test tonight...I did a simple 50,000 iteration of a standard for next loop in both my Laser C and GFA Basic 2.0 compiled...The Laser C was about 5 times faster than GFA...I do NOT see this as much of a speed problem, as they are both pretty darn fast, and seeing as how GFA is a HECK of a lot easier to program in than C and the fact that now there is a way to easily (fairly) transport GFA from the ST to the IBM in BOTH MS-Dos AND Windows, I can't see much reason to go insane trying to learn how to program all the intricacies of an IBM in Windows with Turbo-C...I think GFA is a real winner!!! I only wish (hope) more programmers take to it for the IBM soon...

Although I have never used this program, what you describe sounds very similar to what happens when you run monochrome emulators from the desktop. Try putting in your \AUTO folder, it will then run before GEM is initialised and takes note of how big the fonts are etc.

> (602)795-7633

Sorry, Doug. I meant PC cache programs running under ATSpeed.
ST cache programs are OK...but they don't help under ATSpeed.
Now, you reminded of one thing the tech person (where I got
ATSpeed) told me. He said, there is supposed to be some way
to access ST programs from within ATSpeed to help with the
msdos mode.

On page 60 of my manual, it states "All peripheral hardware
can be accessed with some knowledge of Assembler." I think
this is what the tech person was referring to...anybody out
there know? and if so, anybody out able to do anything?

... stuff deleted criticizing GFA and praising the "virtues" of C ...

>Look, either change or DIE.

Obviously a CS-type preaching this conformist BS. C is not the be-all
end-all of programming languages. I believe it has its place as does
every other language. The name of the game is getting the job done
with the least amount of man-hours. Choose the appropriate language
for the task. I've programmed in many different languages.
Preference is based upon what needs to be done and how long it will
take me to do it. Unfortunately most C programmers I've encountered
don't think this way. All they're concerned about is some slick way
to incorporate this or that feature of C into the code with absolutely
NO REGARD for the integrity of the final result.

Sorry for wasting bandwidth. I hear this stuff all the time and it

The big reason I never bought one of these was that all the accessories were insanely expensive. I thought I remembered one of those expensive accessories being an expansion cage.

Anyway, it might make an interesting case study to see why TI's efforts at selling consumer products, which had looked so promising in the days of speak-and-spell and the early calculators, failed so badly with the 99/4A, later generations of calculators and upscale digital watches.

With the MiNT 0.93PL2 kernel i get MTOS it wouldn't run on my ST. I replaced
the Kernel with the new MiNT 0.94 kernel an it works :-). Any further
questions ?

No, I haven't. We're used to things costing 50 or 100% more here, but 300 or 400% doesn't seem to make sense.

Life rough in Finland? Well, it IS cold here - it's snowing right now - but we do have central heating and running water and things. As regards education, it's free....

4266. GNU C 2.1 and floats

Newsgroup: comp.sys.atari.st
Date: 1992-04-26 17:28:42 UTC
From: as327@cleveland.Freenet.Edu
Message-ID: <1992Apr26.172842.11818@usenet.ins.cwru.edu>
Source record: 222946
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Does anyone know why I would get the following message when trying to link a program compiled with GCC 2.1?

blarf.o: Undefined symbol ___floatsisf referenced from text

As you may have guessed, 'blarf' is the only module in my program which uses float's. I am using the latest version (19) of mintlib and everything compiled just fine under GCC 1.40. Did I make a mistake in assuming that all I had to do was update my compiler binaries (.TTP files)? Or do I need another library?

Regards,

This is exactly what happens.

|>
|> Someone mentioned that the screen seems to "jump" in blocks of 5. Let me
|> suggest that n=4.
|>

You can determine the number of extra lines before the 32k`s (or more if you have
a TT) has to be moved in the mint.cnf file by saying:

HARDSCROLL=24

or whatever number of lines you want "extra".

Try copying a ~200k textfile to /dev/stdout on a TT and you'll be
really impressed :-)

From: bferrer@Bonnie.ICS.UCI.EDU
Message-ID: <9204261118.aa02939@Bonnie.ics.uci.edu>
Source record: 222949

Hi... I just ftp'ed the new gcc 2.1. It looks great so far. It finally can do templates on the g++ side!!! But when I compile a C++ program with a cout and a #include <stream.h> directive, it gives me a couple of warnings of "#pragma once" plus it alo says __ls__ stream unreferenced or something like that. Did I miss a new port of the libs and include files somewhere?? The new includes that I saw only supported gcc and not g++ and the same for the new libs.

thanks in advance,

bill

>variables (i.e. structures and type ranges).
>

After programming in GFA BASIC for a long time (now using 3.5), I recently learned about "linked lists". I can't seem to get the concept to work with GFA Basic. Is it possible to implement linked-lists in GFA Basic? Somehow, there does not seem to be an easy way to just ask for a couple of bytes of memory everytime one needs it, without resorting to MALLOC. (?). (Or having a 32K limitation on size). C let's one easily do this, right?

The fact that GFA Basic has an editor/interpreter can't be beat. For most casual projects, they can be finished fast, and the final compiled code runs very fast. I've even done a complete multi-user BBS program that ran quite fast (and not so well coded, either).

Perhaps someone can post a small routine to handle lists in GFA Basic (3.0 and up) on c.s.a.st.tech? (If it can be done. Perhaps I missed something..)

4271. gemulator

Newsgroup: comp.sys.atari.st
Date: 1992-04-26 20:40:29 UTC
From: george@electro.electro.com
Message-ID: <1992Apr26.204029.2447@electro.electro.com>
Source record: 222951

I've read most of the postings regarding the gemulator
and have come to believe that most of messages stem
limited imaginations. This is a very serious problem.
come on people,

THINK THE UNTHINKABLE!

Give it a real try. What could one possible do with
such a combination of hardware/software?

I saw the gemulator at the ACE92 show, and my thoughts
on it were thus:

Ok , here we have a software platform which I really
like, the ST . My job has led me to develope software on
machines like the Sun, the Mac, PC (old and new) and
the ST is still my favourite.

And now (soon), I have access, through the gemulator,
to a progressive hardware platform. Today it's the 486 and
SVGA but its changing fast.

Once the bugs are worked out, I'll have an ST on this
piece of 486 hardware. Great. But that's only the beginning.

How often have I wished for those extra colours, that
higher rez, that faster speed, THAT NETWORK ACCESS!

What Derek has made possible is a virtual ST.
The virtual ST's -hardware- can be redesigned in -software-!!!
Just think on that a minute......
It is only limited by the current x86 hardware platform,
and this platform is not static.
Oh, if I only had 48 hours in a day!

My congratulations to Derek.

He has moved us one step closer
to that idealistic world where you can put one machine
at home on your desk and access virutally any software
in the world. He has taken power out the hand of the
few, and given it out to the many.

Man! It just makes me shake my head is disbelief when
I see the belly-aching goin' on.

"Where there is no vision, the people perish" -King Solomon

4272. Canibalizing the ST...

Newsgroup: comp.sys.atari.st
Date: 1992-04-26 20:58:29 UTC
From: jared@midiline.la.ca.us
Message-ID: <74VuJB3w165w@midiline.la.ca.us>
Source record: 222952

Does anyone know if: 1) there is an MMU that will work on the ST, that is cheap, and that will increase RAM use from 4Mb or 16Mb? And 2) is there a way to hardware-mod the ST to access all 512 colors at once?

In other words, is it possible? Also, what is the likelihood of caniblizing the ST and essentially make it into another machine, not really, but system-wise, as in the OS, hardware, and stuff?

Reply in Email... to the address below.

What you are hearing is your HD keep itself from getting "stuck" in one place.
I am not quite how this problem (sticking) happens, but DC software made a
program called DC-Nostic to fix it on HD's that don't do what yours and mine
(Seagate ST-296N) do. So it's NOT a flaw, it's a feature!

>
>1) Far more effective in handling the machines memory resources.
Please give examples why? I am a little skeptical of this statement.
>
>2) Performance won't even be comparable. C kicks but boy.
OK, so you can write slick C programs that kick butt? Who says you can't do the same with GFA basic? It's not too far fetched for a good programmer to utilize the POWER of a high level language to write an *ss-kicking program in GFA BASIC. (If you really want to kick butt, write in assembler!)
>
>3) Pick any platform to run my program on. Localize machine specific features
> for a wide variety of machines (software markets) (MORE MONEY MORE MONEY..)
Who says they are writing for other platforms? (MIDI and Fantasy Games on a Sun workstation???)

Why not? The biggest part of making money is MARKETING! If you don't advertise and hype your product you will DIE. It has NOTHING to do with what language it was written in!
>
>Look, either change or DIE. Its time to dump GFA and become a competent C
>programmer. The ST is too dinky of a computer to restrict yourself like
>that...your also missing out on some really good opportunities to program
>better hardware....ie MIPS 4000 machines, HP's Latest workstations...
What kind of computer do you own? And why are you so down on BASIC? Did you fail a class in BASIC programming or something? I think C is a great language, but sometimes it is QUITE DIFFICULT to debug. I don't own a MIPS 4000 nor an HP workstation, so I'd be quite happy programming my ST with GFA BASIC.

>
>-Greg
Dom (alvear@cs.jhu.edu)

P.S. I am not trying to start a C vs. BASIC war as the language really has NOTHING to do with it either. Since GFA BASIC is a compilied language then it is possible for the compiler to write some fairly competent code! A C compiler can produce sh*tty code if it's compiler s*cks. And a BASIC compiler can produce amazing code if the compiler optimizes well. It is not a matter of language but a matter of implementation.

Sounds to me like you have a memory problem. When I bought my Mega STE, it came with one meg. The day I brought it home, I put in two meg. However, I didn't know that the SIMMs went in the second and last SIMM slots. I popped them into the first two, and got vertical bars on the screen. Once I called my dealer, and he told me how to put them in, all was well.

So, it sounds like you have a bad set of SIMMs, unless someone installed them wrong.

P.S. What is this thread really about? I mean we are WAY off topic now.

4281. Another Question from the new user

Newsgroup: comp.sys.atari.st
Date: 1992-04-27 02:08:04 UTC
From: AKH104@psuvm.psu.edu
Message-ID: <92117.220804AKH104@psuvm.psu.edu>
Source record: 222961

Thanks for all the replies! The only other place I get service like that
is from the 8bit section. Atari users are great...but Atari itself is...blah!

Ok, $850 for a mega ste4.....um..why should I get this instead of a 4 meg ste
? What are the hardware diffferences?
Seeing as how there are "some" pieces of software that wont run on an ste and
TT is this because of the new TOS roms are just because people didnt listen
like with the old 8bits? Is there a fix for this like a translator? (highly
doubt it..8-( )
Flash is supposed to be the best term program...is it? what terminals
does it emulate and are there any better term programs since flash.
(I pray that its easier to use that Pro-Comm+ on the IBMs!!!!! I'm so
use to Bob-term on the 8bits that this program is sooooo stupid! Can't even
capture text correctly!!!!!)
If I wanted, say a professional system that I could show up my 486dx50
friends with...what software would I buy?
Andrew.....thanks for all the help...hope to scarf enough money together
this summer to obtain one!

That makes sense. The reason that I thought it was the ICD was because we
use Seagates in our PC's at work and I never remember seeing this - BUT -
between the fans in the machines and the generally noisy environment
(compared to my desk at home) you'd never notice it by accident.

>
>P.S. What is this thread really about? I mean we are WAY off topic now.

I don't know, really -- I've been ignoring most of it, but when it degenerated into a "GFA BASIC vs. C" flamefest, my interest got piqued.

Look, guys, can't we just let each other program in whatever source code we want? If you've got criticisms against another guy's language, let's keep it to yourself and be civil about it. If there was such a thing as a universal language, the US military would have used it years ago. The fact that Ada is still _not_ universally accepted is my personal reasoning that it's not so great (grin), but I digress.

****
* WARNING: The following text is all PERSONAL OPINION, and is not intended *
* as a flame of any sort. If you are offended, it's your own fault. B-) *
****

For the record, I started off with Atari 8-bit BASIC, tinkered with Pascal and Lisp, and am now a big C fan. I've seen GFA BASIC when it first came out, but didn't care for it -- I didn't like the lack of GEM support (GFA BASIC 1.0 "psuedo-GEM" routines are an abomination B-), and the thousand-and-one commands to do a thousand-and-one functions ("Draw a circle", "Draw an oval", "Draw a rectangle", etc.). The original editor's excessive user-friendliness drove me nuts as well.

I know that GFA BASIC has now made some nice strides, but I'm still in no rush to program in it. I like C's simplicity and portability, but if you want to code in GFA BASIC, that's your choice. Just don't ask me to be supportive.

C is not a perfect language, but it's very flexible, and it doesn't get in my way, so I like to use it. A clumsy amateur can wreck a lot of havoc with a little C code, but then what are those clods doing playing with such a power tool, anyway? B-)

(Also further IMO: Laser C is still one of the coolest C development platforms on the Atari ST line. It's a little flaky with the later versions of TOS, alas...)

****

>Does anyone know why I would get the following message when trying to link
>a program compiled with GCC 2.1?

>blarf.o: Undefined symbol ___floatsisf referenced from text

gcc 2.1 is using new stuff in libraries. One of reasons is that
is supports new types, like 'long long', which did not exist before.
Therefore one needs libraries patchlevel 79 which were placed on
a.a. It is advisable to get immediately an update20.zoo and
raise patchlevel to 80. This is imperative if you are going to
hack and recompile libraries. If you will not do that expect
surprises.

It is somewhat unfortunate that we have now separate sets of
libraries for MiNT and for TOS. I hope that they will merge in
not so distant future. They are not so different. MiNT librararies
are based on older versions of gnulib which had known bugs.
This does not mean that the current gnulib is bug free, but that the bugs
are less known. :-) I did not trace MiNT libraries carefuly
enough to know the state in which they are right now.

BTW - the symbol in question provides an entry point to
long integer to single float conversion routine. Something
like that should be in MiNT library, I suppose. So with little
creative hacking you should be able to compile your program
even with old libraries.

From: grillo@firenze.OAS.Olivetti.Com
Message-ID: <54081@olivea.atc.olivetti.com>
Source record: 222969

Hi there,

I'd like to expand the RAM memory of my 1040ST (1Mb now) with a third-party
memory board solution, but I do not have any Idea of what exist on
the market, what I know is the features that I'd like to have from
this kind of solution:

1) All plug-in (not at all or minimum soldering required)

2) SIMM based

3) No RAM chip option (bare board, just SIMM sockets)

4) Up to 4 Mbytes

5) Cost less or equal 150/200 $

Do you have any idea of which are the company doing St memory expansion
matchings all or part of the above features?
Opinions and experiences are Welcome, also indications of where I could
find (if exist) such a board in the Bay Area (Sf,S.Jose,Cupertino).

Thanx in Advance

Savino

>What's goin on?, neither ICD of Spectrum Holobyte could help.

Quite a few games just assume a 520ST and use $78000 as video RAM. This means that when your hard disk comes up with a few TSRs an accessory or two plus GEMs own workspace the chances are the dumb program will bang its head on its own video RAM. This may be what Falcon is doing.

Other crimes against ST HD owners include loading programs and data at absolute addresses in memory regardless of who owns such memory. This was very common in the old days when software vendors assumed that TOS wouldn't need any more workspace beyond $10000 so just loaded their code there. These days there are two schools of thought:- Play by the rules and remain TOS friendly OR kick out TOS and take over the whole machine. The 'kick out' philosophy is not a route to HD compatibility.

When you see the same program running on PC and Amiga hard disks you begin to wonder at the mentality of companies that cripple their ST products.

BTW: One fun thing you can do if you have wads of memory is to put some AUTO booting games in an RDY RAM disk. RDY uses the end of RAM for it's diskspace so the program can work fine in lower RAM. Make your RAM disk bootable but it's a good idea to make the first thing in its AUTO folder a program that will wipe resvalid ($426), memvalid ($420) and memval2 ($43A). That way the machine will cold boot when you reset and not keep loading.

Atari UK waited a year longer than every other Atari subsiduary before making
TOS 1.4 available. What do you think they'll do about MTOS. We have MiNT now
and I guess that writing and using 'clean' programs with it will prepare us for
the day when MTOS finally comes.

The Calamus font format has some more information (step-kerning) than the PS-1 format. I've never seen a official description of it, but have puzzled out some of the major things of it. I'll mail them if interested. (I don't have them at hand now, and fear my comments are still in Dutch)

4297. Re: Midi Software

Newsgroup: comp.sys.atari.st
Date: 1992-04-27 08:58:35 UTC
From: dan@hpwin052.uksr.hp.com
Message-ID: <95630007@hpwin052.uksr.hp.com>
Source record: 222977

Hi,

Yup - 16 channels is hard-designed into any MIDI setup. The identifier word that contains the information ("status byte") is 8 bits long and has 4 bits for channel number and 4 bits for op-code (MIDI instruction). So, for example, you might get a status byte that means "Channel 6, Note On". It's the following bytes that provide info on WHICH note, and so on. So in the normal run of things, 16 channels is a maximum. However, some sequencers (eg Cubase) can work with a plug-in MIDI expander device, which effectively has four (I think) MIDI outputs, EACH OF WHICH CAN DRIVE DEVICES ON CHANNELS 1-16. This means that you'll be setting up separate MIDI paths physically; and your sequencer will then have 4x16 MIDI channels to use, so you can control 64 synthesizers, modules, samplers, mixers, tape transports, lighting controllers, etc, etc.

Summary: 16 channels is the maximum for any single MIDI setup; but some sequencers make use of hardware which provides several MIDI setups in parallel.

As for sequencer, I use a thing called "Prodigy" from the British company "The Digital Muse". It's a budget sequencer, ideal for home recording work. Actually, I'm sorely tempted to upgrade to their professional sequencer, "Virtuoso", of which I've got a demo disk. It's very very good, and suits my style nicely. The Digital Muse are:

The Digital Muse Ltd,
82 Tachbrook Street,
LONDON
SW1V 2NB
England.

"Prodigy" costs 135 pounds, and "Virtuoso" costs 299 pounds.

Regards,

Dan Bennett.

I bought STalker to improve on Uniterm but I'm still using UniTerm. STalker
is very nice (DA, windows, large virtual screen) except:

o It is very slow with a 9600 baud link; text scrolling keeps me
waiting. More importantly, file captures are slow and the zmodem
runs at about 300 cps. With 1986 vintage rz, I get > 1000 cps
with a 9600 V32 modem. I guess with a 2400 modem, the bottleneck
would be elsewhere.

o Getting the usual 24 line by 80 char VT100 screen is difficult.
You have to give up scroll bars and/or change fonts (slowing it
further).

I'm still waiting for the perfect terminal program; in the meantime,
it's Uniterm.

4301. Bug in MINTSHEL

Newsgroup: comp.sys.atari.st
Date: 1992-04-27 11:55:05 UTC
From: jensk@hpbbrd.bbn.hp.com
Message-ID: <86010013@hpbbrd.bbn.hp.com>
Source record: 222981

Hi all,
I've noticed a bug in MINTSHEL that seems to have persisted in all versions since it was called INIT.PRG. If MINTSHEL encounters a character that has the most significant bit set, it quits. This happens even if the character occurs in a comment (not very nice if you write German comments ...).

If anybody could tell me how to reach Alan Pratt, I'll alert him to this; thanks in advance.

Jens Kilian.

>still usefull..

You don't need it! The functionality of Pinhead is built into TOS 1.4!

You set a bit somewhere in the program header (I use an Atari tool I picked
up from a PD site to do this) and when TOS loads that program, it doesn't
clear the rest of memory. This is the same behaviour as Pinhead, is it not?

I think you're wrong! GFA stopped support for Atari ST/TT computers.
GFA compiled programs don't run correctly under MiNT, and MiNT is
the Kernel of new Atari MTos. Could you risk to develop a program
in a language that won't work on the next TOS which is due to be
released in 4 months (Atari Fair in Duesseldorf/Germany) when the
manufacturer of the programming language you use doesn't support
the ST's any more???

After the chiclet keyboard failed miserably in the market, TI went to a more standard keyboard setup. The original peripherals added on to a bus port on the side of the machine. This was somewhat hilarious in that if one added several peripherals, the normally foot-wide (or so) machine could grow to three feet wide or more! (Make sure you start at the left end of the table with the CPU. :-) Eventually, TI came out with an expansion chassis, so that folks could reclaim their table space. I remember it the same way you do - very expensive. The final nail in the coffin was TI's addition of a proprietary circuit inside the ROM cartridges. This meant that developers were *required* to have TI manufacture their cartridge, or it simply didn't work. (And folks think Nintendo controls their market. :-) Anyhow, it would be hard to imagine ways to get a more closed (restrictive) architecture than that.

(Folks who continuously complain about not getting TOS internals information from Atari should contemplate that for awhile. :-)

R.C.G.

P.S. In case you are wondering, I never bought one either. :-)

Do you know that the new Rufus 1.10 is now delivered. Just look at it.
Rufus 1.10 (or better 1.11 R4) has many improvements and changings compared
to Rufus 1.06 (even its major release number has not yet increased).
New since 1.10: All settings will be saved into a batch file not into
RUFUS.INF! Phonebook is only limited by storage space
in memory. Capture Editor(!) in which you can search
text or cut text and resend it onto the line.

Features in 1.06: Runs as DA, its quite easy to handle, full GEM-Interface
works in all resolutions (Including Overscan & BigScreen).

Terminal Types: vt100, vt52, tty

Protocols: X-Modem, X-Modem-K, Y-Modem, Y-Modem-G, (external)Z-Modem,
(external)Kermit, ASCII, MZ-Y(?), MZ-X(?)

I think it's the best program for the money to pay (50,-DM shareware-fee,
that's about $35).

yours,

Benedikt

Get the 3.01 patch if you don't already have it Werner. It makes a
substantial improvement in the ZModem upload speed - you should be
able to get in the 900cps range even on an 8MHz machine (make sure you
turn off the "favour concurrency" setting though).

4307. CAD 3D: new version wanted!

Newsgroup: comp.sys.atari.st
Date: 1992-04-27 14:38:43 UTC
From: alien@clinet.fi
Message-ID: <1992Apr27.143843.105@clinet.fi>
Source record: 222987

Do anyone know if there's new release of CAD-3D? I'm currently using 2.02 version and it's not so good. Ok, it works (enven on TT) but doesn't support 68882/1 or TT's resolutions. I can run it on ST-high and ST-med, but if I try to recolor (in ST-med) TT'll bomb. Any attemps to change colors on color-more will bring my TT Down... So, what I need is a new version of CAD-3D. But, I must know how to handle TT's graphics, memory and 68882. Any other Cad will do also, but it has to know Cyber-formats and it must work with PHASE-4 programs.

If somebody know, where to get new CAD-version or knows where to get any info about it, please reply to this or send me mail. (mail will do it better!).

Hmm... I have a plain-ol' 8Mhz 520STe, running several MiNT
processes in the background, no less :-), and I get 1650cps
regularly with Z-Modem (and Y-Modem G) on a v.32bis link.
Unfortunately, the VAXes here at school can only shove out 850cps
:-(Did you use TurboCTS, did you have "Favour Concurrency"
checked? ["Favour Concurrency" makes STalker give up control of the
computer much more often than it otherwise would; hence, it makes
GEM multitasking *much* faster, but it brings Z-Modem efficiency
down to 35-40%.] I will give you that its screen updates are not
quite fast enough to handle 19.2Kbps, but with TurboST installed,
it's not that bad.

> o Getting the usual 24 line by 80 char VT100 screen is difficult.
> You have to give up scroll bars and/or change fonts (slowing it

If you're using Unix machines, you can simply adjust the
"Rows" entry in your .termcap or whathaveyou - I have it set to 22
lines, which allows me to have the normal GEM menubar as well as the
STalker bar active. But I do agree that not having 24 lines is a
pain sometimes (like now, when using VIeeeeeee! :-

I have a 520 ST from October '85. One of the first. So early that when I had the memory upgraded to a meg last year, they had to swap the mother board out because it was a "B" and they needed a "C" to do the upgrade. They got it done and it works fine. Now I am interested in a couple of new things. I want to upgrade from TOS1.4 to TOS2.06, to 2 meg of memory and maybe one of the new desktops, like NeoDesk. I have a bunch of questions that I am hoping the net can answer.

1. What does TOS 2.06 get me? What does it do or have that I don't have currently?.

2. What are the recommendations for desktop applications?

All help and replies are appreciated. Thank you in advance.

An interesting hypothesis. Unfortunately, the respondent failed to mention that it is a DOWNWARD correlation, acting against the already high levels of spirin/Tylenol usage for which C program maintainers are famous. :)

As an aside, I would suspect that the call for GFA developers has more to do with the relative PORTABILITY OF CODE between the Atari ST and the IBM GFA compilers.

Also, one doesn't =REQUIRE= a 4 megabyte machine to write code in GFA BASIC, whereas anyone attempting to do anything remotely complicated with GNU C, as an example, will not only require 4 megabytes, but will also require about 20 megabytes of hard disk space to use the C compiler effectively.

-- David Paschall-Zimbel

(NOTE: I have the required memory and disk space, and haven't ever written anything in GFA BASIC. I just don't like language bigots spouting nonsense.)

4318. HARDWARE: CyReL CyberCube videocards

Newsgroup: comp.sys.atari.st
Date: 1992-04-27 17:31:34 UTC
From: jonal@sofus.dhhalden.no
Message-ID: <jonal.29@sofus.dhhalden.no>
Source record: 222998

The CyReL card(s) mentioned in the recent Z-Net mag are distributed and marketed by tms GmbH in Germany/Europe. This info is from an ad in the March issue of ST Computer:

CyberCube Sunrise
256x200 to 1280x1024 freely programmable.
Max. hor: 4096, max vert: 1280
Virtual desk up to 4096x4096

1280x1024 256 colors 65Hz
800x600 256 colors 150Hz
1024x768 256 colors 100Hz
640x480 16,7M col. 65Hz
800x600 16,7M col. 62Hz
1024x512 16,7M col. 58Hz

All resolutions with 8bit Alpha channel for VIDIMIX 16 videoeffects. TrueColor gammacorrection also at 16,7M colors, 2 20MB/sec. LAN ports for networking or videophones, Genlock ready and realtime video. Up to 4 cards simultaneously with extended VME-bus.

Price: DM 4198,- (US$ 2.500,-)

CyberCube Serenade
Same first lines as above

1280x818 256 colors 65Hz
1024x768 256 colors 80Hz
640x400 16,7M col. 80Hz

Virtual desk of 4096x4096

All res. with 8bit Alpha channel, TrueColor cammacorrection also at 16,7M colors, integrated VIDIMIX Genlock module, Composite PAL Video In/Out ports. COM, Video I/O, RGB analog ports. 8Bit Alpha channel is 4bit Z-buffer and 4bit Alpha channel when used with video.

Max 4 cards simultaneously with extended VME-bus (MultiScreening).

Price: DM 1898,- (US$ 1.150,-)

I've sent a fax to tms to get more info as I think these cards are really interesting...

Contact: tms GmbH
Dr. Gesslerstr. 16

W-8400 Regensburg
Phone: + 49 941-95163
Fax : + 49 941-991236

More info when I get it. Anyone else knowing something???

Greg, do you think that by taking the most popular/obvious line, then
shouting loud enough for it you'll make friends?

4320. >>> ATARI SITE LISTING - REVISED, a bit! <<<

Newsgroup: comp.sys.atari.st
Date: 1992-04-27 17:46:48 UTC
From: woocm@essex.ac.uk
Message-ID: <3209@sersun1.essex.ac.uk>
Source record: 223000

Atari Netters,
Here is my revised list of where to get your bargain
PD software around the world. As before the list only contains
sites of real (no offence to smaller sites :-) significance.
There are a couple of new sites, and some corrections. The
list is not necessarily still, bug-free so to speak, but i'm
almost postive it is. All the usual rules about not being
responsible if you burn your hand in a toaster while reading
this and attempting to get compensation off me apply, funnily
enough!

A plea to all those of you who spy a mistake, addition
or even feel as if this list could be improved, such as a
mickey mouse logo, type comments are more than welcome.
Send all flames, etc. to.....

woocm@essex.ac.uk

That's me by the way!
ENJOY!!

UPP201@ibm.rhrz.uni-bonn.de writes:
: Gnu less consistently crashes with two bombs on my TT.
: Any ideas why?

Big deal... less has problems with CR-LF ... it doesn't
work on some files that don't end with CRLF, creating a
use*less* zigzag screen...

Are there any atari-ported versions of less that fix this,
or do I have something to do this summer?

4323. 1st word

Newsgroup: comp.sys.atari.st
Date: 1992-04-27 18:47:00 UTC
From: blunden@ishtar.physics.umanitoba.ca
Message-ID: <27APR199213475714@ishtar.physics.umanitoba.ca>
Source record: 223003

I've got an older (~1986) version of 1st word, which has a few annoying bugs in it. Among other things:

1) When moving blocks of text around any underlined text doesn't make the trip with the underlining intact.
2) Occasionally the last character of underlined text doesn't get underlined on hard copies, even though it appears underlined on screen.
3) In making tables, whenever the rightmost character reaches the right edge the hard copy has the line spaced out (destroying the alignment), even though everything appears fine on screen.

Is there a more recent version of 1st word without these bugs? Thanks.

This thread is the Amiga people's fault. They are overdue to start their periodic flame war and people in this newsgroup have been conditioned to flame periodically :-) (and the My Language is better than your Language war seems parallel to the My Computer is better than your computer war).

Personally, I like C and hate BASIC - but then I haven't seen any BASIC version in about 10 years. It sounds like GFA BASIC has added some nice extensions (a la FORTRAN 5 vs 4), but if it is true that you cannot define your own structures, I would not be inclined to try it myself.

I have a date setting program that allows easy setting when I boot. I have no
battery backed clock. This program works nice but always reboots the machine
after I set the date. Does anyone know of a better program?
I'd also like to be able to read 3.5 inch IBM PC floppies in my Atari drive.
Does anyone have a tool to do this?
Please Email me with any info or requests for summaries. Thanks.

Well, I wouldn't necessarily say that we have been screwed. When was the
last time that you heard about an Atari Network. There is not such thing
to my knowledge. The demand is not there. There is not reason to use the
LAN port. This is my conclusion.

The speeds I quoted are for compressed files with the modem's
compression turned off. That gives a ceiling of about 1100 cps.
I haven't discovered favour concurrency which would probably answer
my objection.

The same applies to the TT (though its serial 1 & 2).
What I'd like to know is what do you do with these ports when you insert a VME
board? Leave them hanging loose out the back of the machine???

4331. software to set date and read IBM floppy

Newsgroup: comp.sys.atari.st
Date: 1992-04-27 21:02:00 UTC
From: buchs@han
Message-ID: <27APR199214024195@han>
Source record: 223011

I have a date setting program that allows easy setting when I boot. I have no battery backed clock. This program works nice but always reboots the machine after I set the date. Does anyone know of a better program?

I'd also like to be able to read 3.5 inch IBM PC floppies in my Atari drive. Does anyone have a tool to do this?

Please Email me with any info or requests for summaries. Thanks.

>
> Ok, $850 for a mega ste4.....um..why should I get this instead of a 4 meg ste
>? What are the hardware diffferences?

Here's some of the major differences between the 4 meg STe and the Mega 4 STe:

1. The 68000 runs at 16 MHz instead of 8, the thing really flies
along, especially with the cache enabled. If you don't know
what a cache is, it is a small area of high-speed memory which
is used by the CPU for code which gets executed frequently
(or something like that, what did you expect in 3 lines?). This
really does speed up the computer a lot ; I've seen it. :)

2. Totally different layout. The normal STe's are the one-piece
design with the drive on the right, while the Mega STe's have
a CPU unit (they look just like a TT), sometimes called a
"wedding cake" box, with a separate keyboard. The keyboard
itself is also much nicer than the normal STe ones. So, in a
nutshell, it just looks cooler... heh

3. Built-in hard drive. Usually this is a 50 meg or so hard
drive, and before someone pins me down you can also buy the
Mega STe without a hard drive, but with all that power, who
wants to be plodding along on a floppy? (which it of course
still has, ask your dealer about the new 1.44 MB drives, if
you can get one with TOS 2.06 go for it. I don't think the
regular STe's will have a 1.44 MB drive option, but I am
not sure). Like I'm one to talk anyway, I have TOS 1.0 and
one DSDD floppy. :)

4. Two RS232C serial ports instead of the single one on the STe,
this would allow I guess for two modems to be hooked up and
other miscellaneous weird stuff.

5. LAN port for networking support, once someone gets some good
software for it up and running in the U.S.

6. VME bus for connection of graphics cards, networking, etc.,
look for any awesome upgrades to the Mega and TT to be in
VME bus form, it's a pretty standard format in the industry.

Well, that probably isn't a complete list, but you get the idea. Overall,
I think the Mega STe provides for more power, greater expandability, and
a neato-looking computer (who says looks aren't everything?), but as you

know the price is more. Hope you can make a decision, also remember the
new Ataris we have been hearing about seem less than a year away, so consult
your dealer perhaps on that one. :)

Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Hi

If I try to run the tcsh (Mint version) 6.00.03 or like that
within MW (in one window) tcsh just says BUSERROR and exits.
If I start the Shell from the desktop everything works fine :-)
What has to be done to scripts or ?? to make it run nicely beneath
MW. is it a problems with MW's Pseudottys which get created and tcsh don't
likes them ? Could someone tell me more.

Thanks,
Wolfgang

OK, so I know from the sound/convert/st2sparc.doc file on atari.archive
that Mac sounds are the same format as Atari ST sounds. What I need to
know now is - what do I need to play them? in the sound/players dir on a.a,
they mention both SoundTracker and NoiseTracker, but which of these will
handle Mac .VOC or .SND files?

Another trick that might work is to have "TopDown" (distant uncle
of "PinHead") run as your first AUTO program. This assures that all
further AUTO-program loads go into the TOP of memory, which (on
anything but a 512K machine) should be safe from those naughty
games. Now, you might have problems with the hard disk driver,
since it will come in before TopDown does -- maybe some hacking at
it to change its absolute memory address is in order?

>*** New Zealand.. * not like a dying light globe ***

I agree that there are no decent ones. I'm using the demo to Aaron Hopkins' Freeze Dried, and I guess it's about the best option (if you use Zmodem.) It's still difficult to use, and it manages to piss me off daily. I'm going to go back to Interlink, because I have no way of knowing if any major changes have been made that would solve my problems. Maybe someone can help me...

The problem is that the individual settings for terminal emulation are not working. I use ansi for my unix linkup, and vt52 for local bbsing. It won't switch automatically when I pick a new bbs slot from the autodialer menu. Anybody else had this problem? I have to adjust manually from the main menu's RS-232 submenu.

My other problem is getting it to upload through Zmodem, especially from the text editor. It won't seem to upload my defined blocks, but that may be because I'm doing it wrong.

This is version D2.12 (demo). Should I order the registered version? Will my problems be corrected if I do???

>

I too, have also formatted disks to over 900K. But the problem is that
the internal drive on my 1040STfm can't read past track 82 (I only know
this now), so for some reason when a disk formatted to 900K started getting
full, the directory sectors got corrupted, and I lost *everything* on the
disk. There is a program called dcmaxtrk.prg which I got from a.a.u.e
which will tell you the highest track your drive can correctly read/write.
I think it's in /atari/dc .

4345. Getting GCC/G++ 2.1 to work (without pragma warnings)

Newsgroup: comp.sys.atari.st
Date: 1992-04-28 04:59:39 UTC
From: dmb@wam.umd.edu
Message-ID: <1992Apr28.045939.18069@wam.umd.edu>
Source record: 223025
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I've finally gotten hello.c and hello.cc to compile without warnings.
Here are some hints for getting things to work. Many of them have
already been mentioned, but I thought I'd post a summary since some
people are still having trouble.

How to make GCC/G++ 2.1 work:

1. Get more memory. 4 megs may not be mandatory, but I
haven't yet read of anyone successfully compiling anything
with less. The binaries are now up around the 1 meg range,
and it's only going to get worse, so why not upgrade now
while DRAMs are $4 and SIMMs are similarly cheap. G++ seems
to work comfortably with 3,000,000 bytes free, so you
could have MiNT and a nice shell running. (I haven't tried
2.1 under MiNT yet. I assume it works.)

2. Make sure all the pieces are there. Run GCC with the -v
option to see what it's doing. My setup didn't work for
a while because I forgot to copy gcc-as.ttp from my 1.41
directory into my new 2.1 directory. The error messages you
get aren't very informative ("cmd exit code -1" from Gulam)
so you need to check the verbose output of each stage of the
compilation process.

3. Make sure your make.ttp knows how to pass arguments under
the argument passing scheme your shell uses. I'm using
the Sozobon make, which won't work if you have "set
env_style mw" in your startup .g file. If GCC reports
"no input file specified" this is a clue that your
args aren't getting through.

4. Change "once" to "idempotent" in all the files in your
include+ directory to make G++ stop complaining about
obsolete pragmas. I've already done this; if there's
demand I can upload the modified directory to atari.archive.
(If #pragma idempotent is not appropriate here, someone
let me know. I believe it's the "non-obsolete" term.)

Hope this helps. Everything you need for the wonderful GCC/G++ 2.1
combo is on atari.archive; you just have to put all the pieces
together. A thousand thanks to everyone's who's made 2.1 possible on
the ST.

Happy hacking!

Dave Baggett

>20 megabytes of hard disk space to use the C compiler effectively.

I use Lattice C5 on a 1Mb machine and well under 10Mb of hard disk space (most of that is source) and that's with a 150K ramdisk and using the integerated GEM editor thing. The only restriction is that the optimiser doesn't have enough memory to optimise large files when the editor has more than two items loaded up at once.
With a 2Mb machine you could manage with a single disk drive (easily with a HD drive) out disk swapping (After initially copying stuff to ram disk)
I don't know about GNU C, but that isn't a commercial program so it isn't fair to compare it with GFA BASIC (Although since GFA BASIC isn't supported anymore and the latest version is about to be given away on a cover disk, perhaps it can't be counted as commercial either...)
Anyway, I do occasionally use GFA BASIC 2 to do things like create tables of cosines and perform calculations that would normally require a programmable calculator simply because it is the best tool for that job.
Does anybody know what language the GFA BASIC compilers were written it? I can just about imagine the interpreters being written in GFA BASIC itself, but I would be amazed if the compilers were.

Since the memory is still 8MHz and the cache is only small it doesn't run anywhere near twice as fast.

Try taking out a subscription to one of the UK mags, as the ST mag war hots up:

May's ST Format gave away GFA Draft II (adding a pound to the price of the mag).

May's ST User gave away Harlekin (I'm glad I didn't pay money for it - it doesn't seem very useful. The best thing on the free disc was the duck game, my kids love it.).

After April's ST Format (giving away WriteOn), I said that I'd take out a subscription if they kept up the free software. They promise in the May issue to give away commercial software costing at least 50 quid with each issue for the next six months, so I've taken out a six-month subscription (costing less than the increased price of the six issues).

It will be interesting to see what sorts of software they can find to give away over that period.

There is also a new ST mag that I glimpsed on the bookstall the other day, but felt no impulsion to buy and can't remember the name of.

Cheers,

Chris Price

I was using Lattice C this morning, and spent 2 hours working out why my
program wasn't doing what it should. It turned out that it was screwing up
with stuctures. Now, if I had paid for it I would be cross....
Must get a copy of GCC sometime (yes Greg, I do use C).

As far as I can tell, the version being given away is a (slightly) backdated
version.

>Anyway, I do occasionally use GFA BASIC 2 to do things like create tables of

Well, I have hacked up file converters in STOS BASIC. It's about 10 mins. work,
only trouble is that a 30 line program compiles to 55k...

>manufacturer of the programming language you use doesn't support
>the ST's any more???

I think Gary's note refers to the software development
environment that is associated with GFA basic and Turbo-C. And
from my experience I can say his point that with GFA development
of window-oriented programs is a *lot* more easy than with
Turbo-C. While C may have an edge when it comes to execution
speed, GFA definitely has more than an edge when it comes to
development time.
GFA basic surely has some problems. However, it is merely a rumor
that GFA has stopped the Support for the ST/TT, I've never seen
or heard a definitive confirmation for this. I think it is
reasonable to expect that there will be a MTOS version of GFA
basic as soon as it is out.
And finally, if GFA programs crash under MTOS and you still want
to program in GFA basic, it may be a solution to use the GFA to C
converter that seems to be available, at least in Germany...

Look Greg, I DO use C. I just object to your flaming a language which you obviously haven't used or even seen. It sounds like the last BASIC you used was MicroSoft BASIC, c. 1980.

Besides, I think you will find that most versions of BASIC have far more support for a particular machine's features than C does. For a _really_ good example of this, take a look at AMOS on an Amiga.

Aha! I have an N series Seagate too, but with GE-Soft driver, and it makes
the same kind of noise every few minutes. Always wondered what it was...

My Fujitsu does the same... I know it's the drive that's responsible, since
I used to have an old Seagate (ST225, I think) and that never did this trick.

In article <kvmum6INNr1a@aludra.usc.edu> rjung@aludra.usc.edu (Robert A. Jung) writes:

I know that GFA BASIC has now made some nice strides, but I'm still in no
rush to program in it. I like C's simplicity and portability, but if you want
to code in GFA BASIC, that's your choice. Just don't ask me to be supportive.

Portability of C programs is generally achieved by lots of #ifdef's and long
makefiles.

C is not a perfect language, but it's very flexible, and it doesn't get in
my way, so I like to use it. A clumsy amateur can wreck a lot of havoc with a
little C code, but then what are those clods doing playing with such a power
tool, anyway? B-)

I'm sorry to say that there is no such thing as the perfect language. To get around
this problem I use C, 2 or 3 versions of BASIC, 68000 code, Prolog, Lisp.....

4358. 68000 Assembly Language

Newsgroup: comp.sys.atari.st
Date: 1992-04-28 14:28:01 UTC
From: scst21@csc.liv.ac.uk
Message-ID: <1992Apr28.142802.1459@and.csc.liv.ac.uk>
Source record: 223038

I am still looking for any 68000 assembly source code, for the Atari ST(E). The souce code which I have already received has been very useful, but I am still looking for any other programs that anyone has available. I am especially looking for sprite routines and scrolling routines.
Thanks for your help,
Jon.

4359. GCC/G++ 2.1 Help????

Newsgroup: comp.sys.atari.st
Date: 1992-04-28 14:44:07 UTC
From: malay@sae.com
Message-ID: <1992Apr28.144407.7374@sae.com>
Source record: 223039

I need some help!!! Here are the files that I downloaded and their contents

gcc21bin.zoo
libolb79.zoo
gmlibo22.zoo
pmlolb17.zoo
utlbin25.zoo
includ79.zoo

Is this all that I need to get GCC/G++ 2.1 to work? What environment vars
(if any) that are different from previous versions of gcc/g++ need to be
set?? Also, if you have GCC/G++ 2.1 does :

gcc hello.cc -o hello.ttp -lg++

actually work??? My version of "gcc.ttp" keeps attempting a call to
"cc1plus" (even though GCCEXEC is set to c:\bin\gcc-). It seems to me
it ought to be calling "c:\bin\gcc-cc1+.ttp". If I do :

gcc hello.c -o hello.ttp

everything works fine and dandy. So either my environment is missing
something or "gcc.ttp" has a bug in it????

Here's what I have:

```
Archive gcc21bin.zoo:

To make it totally clear once and forever looking at all this recursively
nested articles i'd like to mention that all these noises are part of the
drives internal park function, which do only scsi drives (like the seagate
n-series) perform, when they'ne not accessed for a while. Other non scsi
drives like the older mfm, st506 bus drives etc. don't do so. So it's neither
a question of the driver software, nor of the adaptor, just of the drive.

There are several; the one I like the best is the one I wrote (big surprise there): play20.zoo. It plays signed and unsigned samples, supports stereo, and lets you play sound through the speaker, various 3rd party digitizers, or the STe/TT 8-bit D/A. The cost: free.

It's a command line program so if you want a GEM interface try some of the other programs on there. Check atari/sound/Index for more info.

In answer to a question about ST only magazines, Brian Cooper listed Current Notes and Atari Advantage. Neither of these are ST only (but Advantage comes close).

Current Notes covers the 8bit, while Atari Advantage covers the Lynx (So does ST Informer).

I432 is (was) a 32 bit chip, hence the name "32." It's not older than the
T9900 either.

if you still have the programmers guide for the 650x family as published
originally by MOS Technology, hang on to it because is the best guide to
8-bit assembler I have ever seen. Rockwell reprinted it almost verbatim.

I have a 1040ST with monochrome monitor and mouse for sale. It is in excellent shape, never any problems. It has TOS 1.0 in ROM and a built-in 3.5" 720K floppy.

Please help me by buying this great little machine (My wife won't let me get my TT until this one is sold :-)

ASKING $300

>MW. is it a problems with MW's Pseudottys which get created and tcsh don't
>likes them ? Could someone tell me more.

This sounds like a known problem in Eric's original tcsh port. It would
bomb when run from pseudo-ttys. You should try to get the very latest
version of tcsh from atari.archive.umich.edu. I haven't tested it, but
it is supposed to fix the problem (actually a problem in the MiNT libraries
it was compiled with).

There is a workaround for the old tcsh: add symbolic links to your
mint.cnf script which link MW's pseudo-tty pipes (in u:\pipe) to
entries in the u:\dev directory.

4375. Incompatibility of MiNT_.94 and the POMPEY PACKER

Newsgroup: comp.sys.atari.st
Date: 1992-04-28 20:07:09 UTC
From: wabe@ukc.ac.uk
Message-ID: <784@eagle.ukc.ac.uk>
Source record: 222855

I've only recently installed MINT (v_.94) and on the whole things
seem to be behaving very well. Congratulations to Eric Smith for coming up
with a very worthy operating system advance for the ST.

I just thought I'd mention that my executables, packed with the
POMPEY Packer just will not run on MINT (v_0.94). The same executables when
unpacked or, indeed, packed with any of the other packers I have viz. the
original PACK, PFXPAK and PACK-ICE all appear to run perfectly under MINT.

Which is a pity - because the POMPEY Packer has the highest
compression of all these packers (slow though it may be!).

I, myself, have recently submitted a few utilities to the
ATARI archives - the latest being RDE (all-TOS version of Mark Williams
Co.'s renowned RDY ramdisk Utility) and an associated Mini-Shell, RDSH.PRG.
Unfortunately these (and some others) were packed with the POMPEY Packer.
Obviously people already running under MINT will not be instantly able to
get these to work. All they need do is get the POMPEY Packer and unpack them
(the POMPEY term is DEPACK!!) - OR, if you have difficulty mail me and
I'll endeavour to mail you back a MINT compatible executable.

This, of course, is more in the line of a little annoyance than
a serious fault. Anyone out there happen to know what is it about the
Pompey Packer that makes it incompatible - despite the fact it behaves OK
under all the TOS versions I've tested.

Cheers, W. Alan B. Evans

ALL
I have one set of Apple MAC 128K Roms for sale. They are ORIGINAL
Apple parts new and never used in the box. $150.00 including
shipping via UPS COD in the US. IF you are interested phone
713-326-3877 evenings Central time. Please leave a message if
I'm not available. I'm selling them because I'm more interested
in PC emulation and I'm tired of waiting for AMAX II Plus.
It's in Europe why not in the US Readysoft?

Maybe for you, but not for me. My entire semester's Advanced Compiler Design
class has been done in Laser C at home, and with the University's C compiler
here. I just upload the source, recompile *.c, link *.o, and I'm set. Works
great on both ends, no #ifdefs, makefiles, or whatnot.

b) Interesting that you consider 8088 which came out long ago like 6502s,
and 68000 - 68020s is the same idea!

> (c) WINDOWS will still be the system in five years? I have a copy
>of Creative Computing from 1987 which talks about how wonderful
>windows was and will be. It wasn't then (as we know now) and still
>isn't (as we know now again as the latest bitch reports pour in and

It came true didn't it? Windows 3.x is quite nice, it has surpass support of
STs now! There are more developers for Windows products than there are
for STs or even TTs.

>isn't (as we know now again as the latest bitch reports pour in and
>Microsoft promises that NT will fix them if you just wait one more
>year). Windows began as a pig for memory with lots of bugs and is now
>a bigger pig with meaner bugs. In the meantime, a lean and mean

According to Microsoft, win 3.1 solve most of the bugs that was originally
in win 3.0. Why do you state it contains more bugs when it's not true.
Pig for memory, you can still run windows 3.1 with 2 megs of RAM for
386 enchanced mode just like win 3.0.

>little system like GEOworks seems capable of doing everything Windows
>can do in a tenth the memory space. I would not bet on windows
>surviving the next two years,much less becoming the standard.

Try telling this to over 9 million windows 3.0 users (just the register buyers).
With new items for windows such as IDL, and with existing items such as
Xwin (X windows for Windows 3.0), Mathematica, etc..., win 3.x may just
survive longer than most systems OS out there.

> (d) the Gemulator may wellmake 486s worth buying.
>

WRONG
Worth more than just buying the gemulator. I like to see some more supports
from developers for the ST like we see today for pcs. There currently
around 75,000 titles for the pc world (not including PD/SHARE). Why

not get the 486s for multi-platform system! By the end of the year, the 486 system should be able to run NeXT/Unix/DOS/ATARI STE/MAC/OS/2 and whatever is out there for the 486pcs.

You're not tied to Supra's software. In fact, I'm running Atari's
HDX 5.0 software with my Supra host adaptor in preference to Supra's
driver. I mailed the Atari software (suitably repacked with a portable
archiver) to the moderator of comp.binaries.atari.st, along with a disk
optimizer and repair utility that works with the Atari driver. It
hasn't appeared yet, but keep an eye on that newsgroup.

I have the most recent version of Supra's software, and there's nothing
there to get excited about -- the changes from earlier versions appear
to center around support for Syquest cartridge drives.

Hi folks,

If you know nothing about AT Speed C16 (hardware 286/16mhz PC emulator)
read no further.

I have only ONE annoying problem with my AT Speed board to do with
running Windows 3.0 under DRDOS V5.0. I have to wait for at least 15
minutes before I can invoke Windows, otherwise the system freezes on me
when the windows introductory screen is displayed.

Once the 15 minute period has expired Windows is wonderful. This problem
only exists for Windows all my other PC software works immediately eg
DBASE III+, Wordstar, Microsoft C. I assume this problem is hardware
related, memory maybe. My configuration is 4mb STE, SM124, Powerdrive
900 (100mb) and external floppy.

Thanks in advance.

PS. Apart from this minor irratation the AT Speed C16 is GREAT.

You might also look at ST Applications, published monthly by the ST Club. 12 months' subscription is 15 quid.

It's a bit like ST World (UK) used to be, though performance is patchy. Its heart is in the right place, though.

I have no connection with the ST Club, but I do write occasionally for ST Applications.

From what I remember, the HBL interrupt handler installed by TOS simply
lifts the interrupt level of the processor so that the HBL interrupt is
masked.

You therefore have to install your own HBL handler and then lower the
processor interrupt level to ensure that it works.

I use the ICD software with a Supra Host. It works fine, although it
refuses to de-fragment the drive, saying that it will only work with
an ICD host.

It may be interesting that just right now, there's a program I've
written with GFA basic 3.5 (!) running on a TT without any flaw.
This clearly shows that it is not GFA basic itself that causes
the problems, but rather the programmers.
I think there is some justification for CrackArt screwing up on
non-standard setups since it has been written as a program for
lo-res graphics. Regarding Sagrotan, I think it's a good example
for problems caused by the programmer, but it's still a useful
program.

4397. AZERTY-QWERTY

Newsgroup: comp.sys.atari.st
Date: 1992-04-29 13:56:34 UTC
From: Kris Van Hees <GUTEST6@cc1.kuleuven.ac.be>
Message-ID: <92120.135834GUTEST6@cc1.kuleuven.ac.be>
Source record: 222870

Hello!

A friend of mine is looking for an autofolder program which can turn his QWERTY keyboard into an AZERTY keyboard. Reason for this is that he is attending typing courses here in Belgium and they work on AZERTY typing machines, and so, if he is to practise at home, he would like to type on his qwerty STe as if it were an azerty one.

Can anyone help him?

Regards,
Kris Van Hees,

Bzzzz! Last I saw anything in print (a few months back), only about 1/3 of the purchasers of Windows 3.0 actually *used* it. The rest of the copies are on the shelf.

I used to use Windows 3.0 at work (386 DX 25 Mhz, 4 Mb, 105 Mb HD, NEC 3D), but gave up on it - it was too much a pain in the a**. I now run DR DOS 6.0 under ViewMax (a pale shade of TOS GEM) using TaskMax as an application switcher. (This is a fairly tolerable setup and a *little* like my ST - but I can't wait to get home at night.)

Anyhow I believe that the best way to accelerate an MS-DOS (or compatible) machine is 32 ft/sec/sec.

(NOTE for the humor impaired - that is my *very subjective opinion*)

So, when you were a child did a GFA come along and beat you up or something? You have this hatered towards it that seems unfounded. Basicially, Don't program GFA, its bad.

Why would it be bad? Its fast enough for some things.. in fact most things that I do. I run a BBS in a GFA _interpreter_ and its fast enough to handle high speed modems. The only place I had too much slowdown was when I was plotting bezier curves on an interupt to incomming music data and when I did 3 or more waves at the same time it got fairly slow.

Don't overlook languages just because they are 'Basic'. Its great for doing quick programs, and its easy enough to make them look professional if you don't just take the easy way out. Don't use the Gem font is a biggie. Make your own icons and bit maps for logos... :)

Basicially.. I know some C.. and am learning more, but I prefer GFA for quick and dirty ST programming. I could care less right now about portability since the programs I write would be of little use on an IBM or Sun or whatever.

I would hope that MOST intelligent people saw most of my posts as an
attempt to solidify a particular applications area for a language.

GFA BASIC is fine for communications work. Communications most of the time
don't require high performance languages...

For example a terminal program...that does simple ANSI emulation.

In affect, the best software engineer is able to see what tools he needs
for the job, and can competently apply them to solve the problem.

If you know whot to do, and what to use...you will never go hungry..
(Currently testing that theory of mine...)

PS: BASIC SUCKS.

4403. TT's ST-ram

Newsgroup: comp.sys.atari.st
Date: 1992-04-29 16:31:20 UTC
From: alien@clinet.fi
Message-ID: <1992Apr29.163120.28430@clinet.fi>
Source record: 222883

I'm plannig to get some new memory to my TT. It has now only 4 megs ST-ram, there's not any of TT-ram, not even this TTramcard, wich I would need if I wanted to get some TTram. However, I'm runnig out of memory and I found one cheap and fast way to get some more.

Because I'm using graphical applications, which uses ram for storing animation and pictures, I've no need for expensive TTram, ST-ram can do things enough fast. More important to me is the size of memory, speed will come after that.

So, I opened TT to find out, is there any way to get more ST-ram. Fist, under the hardisk was one ST-ram-card, and under that 8on motherboard) were more ST-ram- I removed this st-ram-card to find out how much memory it was holding, and after boot tehre was only 2 megs ram instead of 4. So, after fast count, I noticed, that on TT's motherboard were 2 megs of ST-ram in 16 chips. So, replacing these 16 4C4256-10 chips with 512 or 1024 chips would increace ST-ram up to 6 or 8 megs depending what odel of chips I would use. But before I do anything, I want to find out, is this kind of memory upgrading possible? Has TT any ST-ram limit and if does, how much is the max. size of St-ram? 8 or 16 megs? Less? More? (usefull utilities)... What's the point of having extra ram-card if there's enough room (on motherboard) for more ram?

So, if you know anything of upgrading TT's ST-ram, please mail me and tell what you know.

4405. Re: GFA Basic as a viable language??

Newsgroup: comp.sys.atari.st
Date: 1992-04-29 16:54:24 UTC
From: boblu@tekgen.bv.tek.com
Message-ID: <643@tekgen.bv.tek.com>
Source record: 222885

I have been watching the recent "compiler envy" discussion with much amusement and can no longer resist the temptation to include one developers point of view in the discussion.

Is GFA Basic a viable language? Yep. How about C? Yep, again. And Assembly Language? Bingo! The point is that they are all tools that we use to direct another tool(the computer) to do what we want. These tools have fundementally the same objective but uniquely different capabilities like three different types of screw drivers.

The issue then is not whether GFA is a viable language(it is), but rather given the requirements of your application what is the most appropriate tool to accomplish your goal. Would I implement Diamond Back's fast compression algorithm in GFA Basic? Not in a million years. Only hand optimized assembly language will give me the performance required by the application. What about programming Diamond Back's user interface in Assembly language? No way, the increase in development time is not worth any imperceptable improvement in processing dialog box responses. Use the right tool for the right job.

So where does GFA Basic fit in? For many ST users/programmers GFA Basic contains all of the capabilities that you would ever need.
Basic has evolved tremendously from the language that I first learned(and stored programs on paper tape from teletypes) and in it's current form contains many of the features commonly believed to exist only in "higher level languages". It is easier to learn than C or assembler and development time is generally shortened by library routines that "automatically" do functions that the programmer has to take care of him/herself in C or Assembler. It will produce functional, though not optimal code. The question is do you really need optimal code in your application?

Is GFA Basic suitable for commercial applications? Sure it is. If you write something in GFA, market it, and someone buys it then it is a viable commercial product. However, I can take the product concept with similar features and program it in C and assembly and beat you in the market on performance. The question is whether the market segment you occupy is worth the effort required to outperform you.

Language Application Suitability Matrix

User Type:
Language Novice Hobbyist Serious Hobbyist Professional Lunatic

GFA Basic X X X x o
C x X X X o
Assembly o x X X X

X = Most suitable
x = Less Suitable
o = Not Suitable

The bottom line is that all of these tools are suitable for most applications. It is up to the programmer to determine what is the most suitable language to accomplish the requirements of his/her application.

For those that are interested, Diamond Back II's user interface and some utility routines are programmed in HiSoft Lattice C. The guts of Diamond Back II is programmed in assembly language using HiSoft Devpac Assembler.

One developers humble opinion.

If there's no documented way to do it, you may be able to get rid of it
by searching for the offending string with a hex editor and replacing the
first letter with a zero. (OK, so it's a *direct* approach...) You
might want to make a backup of the executable before doing this. :-)

4409. "xterm"-clone as DA

Newsgroup: comp.sys.atari.st
Date: 1992-04-29 18:13:47 UTC
From: mfg@gmdzi.gmd.de
Message-ID: <1992Apr29.181347.19375@gmdzi.gmd.de>
Source record: 222889

I am looking for something like the X11 "xterm" as DA for GEM (+mint). Together with the PTYs of mint this should be very similar to an ordinary terminal program. It should allow for starting processes (shells) in the background reading from and writing to a PTY. This would result in a desktop with multiple terminals concurrenty active. MW2 is a step in this direction, but it blocks the desktop activities and this is really sad if you are using Gemini. By the way support of the Gemini-protocol would be also fine!

Does anybody know about such a wonderful tool?

Thanx,

>ways to get a more closed (restrictive) architecture than that.
>
>P.S. In case you are wondering, I never bought one either. :-)

Well, I did buy one, and I can tell you that there was no proprietary chip in the cartridge. There was directly adressable CPU RAM (up to some large number) and VROM expansion. The RAM on the cart could be read or written to as if it were just part of memory (hey, it was) or replaced with ROM. I had a RAM expansion cart, and it certainly had no special chips (just a couple of ROM and some RAM).

One thing that can be said about the TI 99/4A, they did carts right.

To avoid the dreaded "DC Squish" message, don't use DC Squish.
Instead, use PFX-Pack, which comes with all versions of Quester's
LHARC (2.01x). It compresses better and decompresses faster.

Besides, it's a LOT cheaper than DC Squish.

>the MPE. My question to you guys out there is which editor(s) do you
>guys prefer or hate? ** Cubase / Omega I or II / Other ** and for what
>reasons?

I haven't used Cubase, but TIGER is a great editor. There are several
editing modes in KCS Omega (the vanilla Edit screen, PVG, Master Editor,
TIGER), so it's quite versitile. By the way, what's the difference
between KCS Omega I and II? I thought there was only one version
(although it allows you to install KCS with or without the "Level II"
options (the Programmable Variations Generator and Master Editor).

>All the software I've seen so far only handle 16 channels.
>Is 16 the max amount of channels that is controllable via Midi normally?

KCS supports up to MIDI 64 channels with the appropriate hardware. I
use Dr.T's Phantom SMPTE sync box, which allows 32 MIDI channels.

>Oops! Almost forgot. I'm running an Atari 1040ST with four megs and
>an ADSpeed 8/16mhz CPU. :-)

Dr.T's software is generally very robust in terms of working with
different versions of TOS and accellerator boards.

I can't make any comparisons because I've only used KCS, but it's a very
good package and an excellent value.

I wonder who is the lamer here, I never stated that the PC is better, personallymany other far superior machines would be better. What I did pointed out
is that from the original posted message that the gemulator is not only
reason to go buy a 486. LAME.

4418. Tennessee Internet Access?

4419. ATARI and not pcs! (Re: darek@microsoft.com & Email)

Newsgroup: comp.sys.atari.st
Date: 1992-04-29 22:11:07 UTC
From: chuj@horton.Colorado.EDU
Message-ID: <1992Apr29.221107.11285@ucsu.Colorado.EDU>
Source record: 222899

Ok now, I like to ask, is my postings soooo negative about ATARI STs? I mean I never went out and totally cut ATARI machines down. I never even mentioned that pcs are so far superior either.
But here are what seems to be the facts:
If a 486 machine can now run gemulator and emulate to ST/STE w/o sound, GREAT for pc owners or whoever is outthere. But why cut down the Messy DOS systems? They are fully capable of handling themselves and most of them are probably better off than us.
Face it, with the capabilities and the price, how are we ST users able to judge why a 486 machine is worth buying. My original posting supporting the 486 is due to the fact that some other guy wanted some kind of flame war with pc owners. I do not enjoy flaming, last year I got into one with AMIGA people, it got pretty ugly. As a ST owner and big supporter for ATARI, I feel even worse off. I'm for the gemulator, it may bring more support to ST/STE , who knows? And I like the price Darek has offered to initial buyers($199.00 + $100.00 for TOS 2.something).

I'm totally sorry if I offended anyone, and that my argument seemed to be on the wrong side of this newsgroup. But really there are no sides, ATARI,AMIGA,PCs,MAC etc... they are just machines that make life more efficient.

Thanks
Jeff

I completely agree, Atari UK must be the worst Atari subsiduary on
the Planet. I met one of the UK Atari guys at the recent 16 bit computer
show in London (he was the one who was *trying* to show off the Atari UNIX),
and was he arrogant or just an arrogant bas**rd. The only reason why I stick
with Atari is because there are some decent people in the company in other
parts of the world who appear to want the company to succeed.

There are a few packers on atari.archive. Are any worthwhile? (I'd look at them if they made programs FASTER to run on an ST, because of reduced disk access time - I didn't buy a hard disk to end up with floppy disk speeds).

Do you mean compiling ST binaries on a NeXT? Sure, Sozobon C 2.0
has #ifdef's for various Unix environments in the source code. Quite
a few people have used Sozobon C on Suns and NeXT computers to compile
ST programs, including a version of the Citadel BBS system (Adrian or
Royce, are you reading this?)

Have you tried the BGACC.ACC that comes with MiNT 0.94? It's vastly
improved over the old BGACC, and now uses normal GEM windows (and will
allow more than one -- if you select the "Background Prg" menu item
while a terminal window is already open, it will create a new window).

(No, it doesn't support the GEMINI protocols, at least not yet...)

Some one the other day sated that I sould not believe what I read in ST-Report, but I disagree some 100%..

Here in New Zealand we get a Znet feed and we are fed up with all the back stabings that are directed towards ST-Report.

It does not show up you Yanks in a good light at all, a bunch of Vendetta loving people.

In fact the way it looks to me that Znet is a Atari Propaganda Magazine and ST-Report is more of a Facts magazine, does not hide any thing and is able to speaks its mind and to be counted and states the facts as they are..

I don't find that with Znet at all, very wishy washy..

Well don't send any more Hate mail I had some last time, and it just show how insecure you Atari bunch are..

Stay tuned for more...

>Pete Ikusz Introl Corporation pete@introl.com

Yes but what you fail to realize is that at the time the 6502 was
introduced by MOS Technology, the 6800 and 8080 sold for $375.00,
whereas the 6502 was introduced at a price of $25.00.
It was the cheap cost of the 6502 that made it possible for Steve
Wozniak and others to implement it in inexpensive computer design.
The extra $350.00 not spent on the 6800 could be used for a TV
or something better. Thus the personal computer revolution began.

Unfortunately the 6502 hasn't evolved as well as either the Motorola
or Intel processors had. But it has evolved. William D Mensch, Jr.
founded the Western Design Center in 1978. He was part of the design
team for the MOSTEK 6502, and before that part of the design team for
the 6800. Western Design Center introduced the 65C02 in 1982.
Later a 16 bit version of the 65C02 was designed called the 65816.
This can fully emulate the 6502 or 65C02, or can run as a 16 bit CPU
with a 24 bit addressing space. Early next year WDC should have
finished the 65832, a 32 bit CPU. Although these new processors
have added addressing modes and instructions, they seem a far cry
from what the 680xx line and the 80x86 line can do these days.
They lack any sort of internalized MMU, but they do have support for

a coprocessor and limited MMU with external circuitry.
WDC is a small company, and their CPU's will never become what the
Intel and Motorola ones are but it is nice to see continued development
along the 6502 line that spawned such computers as the Atari 8 bits,
Commodore's line, the Apple computers, and even from Ohio Scientific.
. The Atari Lynx I believe has a 65C02 running at
8 mHz or something, and the Apple IIgs has an 8mHz 65816...

What really annoys me about games and hard disks is the save game disk. I can live with loading the games themselves from floppies, but its a real pain when you have to keep a seperate save game disk for every game you play. I use my ST mainly for programming, but when I play games I tend to go for the strategy/ RPG types, which generally need a save game. Since I might start playing it, save my position, and not restart for several months, there's a damn good chance the disk is going ot get lost/be used for something else. I really can't understand why games programmers feel the need to write their own mutually exclusive routines for doing this sort of thing when there perfectly good OS support for it built in.

The Pompey Pirates Packer is a reasonably fast one, but I don't use it
any more as anything packed with it immediately crashes under Mint.

Source record: 222769

ST Report.. Hm. Well, we talked about this for a while about a year ago in the FNet Sysops Confrence because of a problem with the author of ST Report. It seems that he would edit and censor any mail that went through his node. Not all, just whatever. Some sysops even sent test messages through there and some never made it out, some were changed.

This resulted in a large number of nodes locking out his node. Routing around it or whatever, but staying away from him.

Now, I haven't read ST Report in a long time, but I have read Znet more recently and they are even printed in magazines for news, so I would tend to trust them a bit more.

4439. Desktop.. desktop.. where is the desktop?

That was the *original* implementation (i.e., consider yourself lucky).
The proprietary circuit was added to the cartridge interface for the last
version of the TI 99/4A that was produced just before it was killed. You
should have seen/heard the hue & cry from the developer and user
communities. (Like I said, one of the _final_ nails in the coffin. ;-)

>getting rid of my ST, but I won't be sinking any more $$$ into it, either.

It's certainly true (at least in my experience) that you can't compile
large files without 4 megs. I had trouble getting GCC 1.41 to compile
many of the Nethack files (which are up to 85K) on a *bare* ST; i.e.,
no AUTO's, no ACC's, using 20K Sozobon make.ttp instead of the
gnu_make.

Since the 2.1 binaries are even bigger than their 1.x counterparts, I'd
suspect that potential problems are even worse.

However, I ran some informal tests and it seems that RAM use is heavily
dependent on the compliexity of what you're compiling. GCC 2.1 will
compile hello.c without optimization with only 1,000,864 bytes free
but fails when you get down below 1M. I don't know how optimization
affects memory usage, but if you're strapped for memory keep your
files very small and perhaps compile without -O.

I love this chart - particularly the category of "lunatic". I know some
programmers that fall into that category. As stated elsewhere, these
are the same people who do not use APL *unless* the entire program can
be done in one line. :-)

Well done!

4445. Memory upgrade for 1040STe

Newsgroup: comp.sys.atari.st
Date: 1992-04-30 13:52:34 UTC
From: automan@milton.u.washington.edu
Message-ID: <1992Apr30.135234.11306@u.washington.edu>
Source record: 222776
Cross-posted to: comp.sys.atari.st.tech,comp.sys.atari.st

Dear Netters,

I hope this isn't to much of a FAQ, but I am preparing to do a memory upgrade on my stock 1040STe. So I had a few questions:

#1. What is the maximum amount of ram I can expand to?

#2. Why do the simms I have in my STe have a (diode?) soldered across pins 1-16?

#3. Do I need to but special simms, or can II run down to Costco and buy 70ns 1 meg "generic" simms?

Any help would be greatly appreciated. Please reply via E-mail.

Thanks in advance,

Not 100% correct:
VRAM works on every TT, wether it has TT-RAM (Fastram) or not (only ST-RAM).
Config is a seperate application, cause there is nothing to config during
run-time (thats what CPX's are for).

Does a matlab like program exist for the atari st computer ?
Does a proper circuit board layout program exist, which
includes a "working" and "intelligent" autorooter ?

4448. emacs 18.57 for MiNT

Newsgroup: comp.sys.atari.st
Date: 1992-04-30 14:15:09 UTC
From: erlingh@idt.unit.no
Message-ID: <1992Apr30.141509.23321@ugle.unit.no>
Source record: 222779

Hello.

Uploaded to atari.archive: mntemacs.zoo

I have ported the complete emacs 18.57 for mint >= 0.93
By complete, I mean you can do all the things you're used to on
Unix(tm) like:
M-x compile
M-x shell
M-x display-time
That is, subprocesses are fully working.

You will need to get hold of the emacs-lisp files in addition.
I didn't want to include them in the package since they are many and
huge and can be picked up almost everywhere.
Get the real ones. _NOT_ those that are hacked up for the ST, and make
sure they originate from the 18.57 distribution.

I compiled it on my 4-meg equipped TT with no trouble.

Thanx to Jwahar Bammi (sp?) and Edgar Roeder who did the initial
porting on which this is based.

Cheers
Erling Henanger.

P.S.
The reason I don't submit binaries, is that I only keep
TT versions of the libraries. It is tiresome enough to have libraries
for 16 and 32 bit ints, mint and the standard library up to date.
To even think about keeping an ST version on top of all that makes me
sick...
If there is interest, I could upload the TT-binaries though,
Just say the word...
Maybe someone that compiles an ST-version can upload the binaries ?

4450. TAB (TOS Adaptor Board)

Newsgroup: comp.sys.atari.st
Date: 1992-04-30 14:50:48 UTC
From: steve@thelake.mn.org
Message-ID: <A1314396318@thelake.mn.org>
Source record: 222781

Wes Newell of Newell Industries has announced an inexpensive board
that makes it possible to install new TOS in old STs. Here's an
informational posting from Fidonet. I don't know anything more than
you see here; I have not seen this product, and I have not purchased
anything from Newell Industries.

Info on TAB (Tos Adapter Board).

Used to install up to 1 meg of rom starting at E00000 in original ST's.
This includes, but not limited to TOS 2.06.

Price= $29.95. Introductory price of $19.95 until 1 June 1992. Does NOT
include TOS roms.

Availibilty = No later than 15 May 1992. I have a tested working model now.

Installation (brief)
Cut 5 to 10 traces on motherboard. (5 on original 520ST)
Add 5 jumpers to mother board. (none on original 520ST)
Remove old roms. You can leave them in and switch back and forth,
but won't go into that here. This requires additional wiring.
Strap pins 1,30,31,32 together on new roms. Bend out pins 2 & 3.
Install new roms in sockets on motherboard.
Connect 15 wires from upgrade board and test.
Installation time = 15 to 45 minutes depending on skills.

How it works:
Intercepts all Exxxxx adressing to glue and converts it to FCxxxx, thus
fooling glue into thinking you want to address the normal rom area.
The glue will then furnish the needed signaling to address the new roms
that are plugged in there.

Advantages over other methods:
This method lets glue do all the normal decoding AND timing. No conflicts
should occur simply because Glue STILL does all the controlling. We don't
add DTACK or other signals that some of the other upgrades that use a
different method do.

Newell Industries, P.O. BOX 253, Wylie TX. 75098, 214-442-6612
Supporting Atari Products since 1980. Registered Developer.

April 24, 1992 - Atari Explorer Announces New Online Magazine!

Sunnyvale, CA.- Atari Corporation and Rovac Industries are proud to announce a brand new online magazine for the Atari Community: Atari Explorer Online. Atari Explorer Magazine, the Official Atari Journal, is now extending its coverage of all things Atari to the online scene, as well. The first issue of the Explorer Online is set for May 1, 1992, and the magazine will appear biweekly, thereafter.

"Explorer Online will team up some of the finest journalists in the Atari Community!" said John Jainschigg, Publisher. "We're excited to be able to offer such a quality product to our many customers. The goal of Explorer Online will be to serve the needs of all Atari users: Portfolio, Lynx, ST/TT, and 8 bit. All of Explorer's regular contributors will be represented in Explorer Online: from music experts like Craig Anderton, to Portfolio Wizards like BJ Gleason. And we are actively soliciting contributions, both to the online magazine, and to our regular, bimonthly print edition. We want to make Explorer Online a solid resource for the whole Atari community."

Atari has teamed up with Ron Kovacs, publisher of the Z*Net Newswire and Z*Net Online Magazines, to produce Atari Explorer Online. "When we decided that we wanted to do an online magazine, it just didn't make sense to completely re-invent the wheel," stated Bob Brodie, Atari's Director of Communications. "In the online Atari community, Z*Net has set the standard for quality and accurate reporting, and it only made sense to invite them to participate in this new venture. Ron Kovacs and John Nagy are among the finest, most dedicated journalists on the Atari scene today. The entire Z*Net staff will be part of the new team at Atari Explorer Online. We're very excited that they have chosen to join us in making Explorer Online the best it can be."

The start of Atari Explorer Online also signals the end of the Z*Net Online magazine for the Atari ST Community. Current plans call for Kovacs' firm, Rovac Industries, to continue to publish their popular Z*Net PC, and Z*Magazine publications. "While there is a certain sense of loss with Z*Net discontinuing, we're very excited that Atari has invited us to be a part of this exciting new venture" said Ron Kovacs, Editor-in-Chief of Atari Explorer Online. "Atari Explorer is one of the finest magazines on the market, and it's very flattering to our efforts that Atari has chosen us to help them with their online magazine."

"When Explorer Publisher John Jainschigg came to me with an idea for a new online magazine, there was no question that we were going to need some outside help. And it was an easy choice to decide where that help should come from. Week in, week out, Z*Net has provided the latest news to the Atari Community for years. Indeed, Z*Net has experienced growth over the years. They have the experience in launching new online publications, like the original ST-Report, ST*ZMagazine, and Z*Net PC. Additionally Z*Net's Atari News Service has appeared in print publications world-wide including: STart Magazine, ST-World Magazine, ST-Informer, ST-Journal, ST-Express, AtariUser, Current Notes, and Germany's PD Journal now Atari Journal. It really just made sense from every side that we considered to ask them to be involved," stated Brodie."

AEO will be distributed worldwide on major information services and networks. Atari Explorer Online will carry up-to-the-minute reports on hot topics in the Atari market: from trade shows to new product announcements. Explorer Online will give you the facts you need to make the most of your Atari investment. Utilities and Atari PD releases, new product demos, product and dealer databases, and other interactive offerings will round out the publication, making Atari Explorer Online the best in online journalism today!!

|> 845484 38% 520433 1 Apr 92 17:12:02+59 d822 gcc-cc1.ttp
|> 94016 27% 68258 1 Apr 92 17:16:04+59 c447 gcc-cpp.ttp
|> 59411 31% 41450 1 Apr 92 13:49:04+59 6594 gcc.ttp
|> 1147218 38% 708336 5 Apr 92 10:26:48+59 e6a7 gcc-cc1+.ttp

^^^^^^^^^^^^
||||||||||||
```

I had _exactly_ the same problem. Did you use Gulam? I did so but I think
that was not the problem.

My gcc (when used with a hello.cc) aborted when it tried to run cc1plus.

The solution is:
Rename gcc-cc1+.ttp into gcc-cc1p.ttp
or (in UNIXMODE) into gcc-cc1plus.ttp !
Then all should work fine.

G++ didn't work before I made this step. After cc1plus run fine until...

And here is my problem:

I tried to compile a simple hello.cc:

```
#include <stream.h>

int main( void )
{
cout << "Hello world!\n";
return 0;
}
```

with: gcc -v -Wall -lg++ -o test.ttp hello.cc

Then all runs very fine, except of the linker (the new version),
which couldn't find some symbols.
The first was ___main (with 3 underbars) and something like
_____os__7pc, _printf (1 underbar).

I think it's a problem of the linker or libraries, but I got the
newest I found. Does anybody know where the ___main symbol is
created or in which header file it is defined?

If somebody out there had the same problem and solved it, I'd be
very happy about some hints or the solution.

It's called 'Atari ST Review'. It's not bad for a first edition, but it's got
a long way to go before it becomes as good as St Format

I've heard of this problem and I suspect it's something to do with MonSTEr not knowing what to do with the TOS 2.0 version number. I believe I had it check for only specific TOS versions. If you can give me a call at BraSoft or send a letter with a screen dump showing the problem I can probably patch it up very easily and post an updated version.

>Mat
>

Yes, Mat, but Pinhead is more flexible and will work with accessories, which the Fastload bit doesn't very well (in fact Atari advise against it). You don't have to flog through all of your programs setting the bit, either, just stick Pinhead in the Auto folder and that's it.

No, Gregory Carter hasn't shut up. I haven't been active as I have been
busy...FINAL exams, looking for a job...(So I don't have to grill the
ants off the sidewalks for food this summer...)

I read your complaint. It was pathetic. A cheap shot.

Whats more, I think pea brains who have to mail to net administrators to
censor or fight thier battles for them are the lowest kind, who don't
belong on any forum in any kind of discussion.

You don't own this place guy, and you can write all the mail you want
to my mail system administrator till your fingers are blue and it still
isn't going to do you any good.

This guy knows me too well on what my stance is on public communications.
I don't even think he really took your argument seriously.

This is a public forum, for free expression.

If you don't like what I have to say, make a kill file you idiot!
(Trust me, plenty of people have, thats their loss...)

--Greg

PS: Nice SIG file. I like it!

Now..on to more pressing matters.

ACICS is now ready and approaches release.

Version 1.0 includes a facility for link mail to UUCP sites, local and
external networking, automated job facilities, and minimal account
management. It begins my final preparations for graduation and will

be my senior thesis on problems/solutions medium scale software development.

Version 1.0 also includes Turbo C libraries for truly awesome communications application development. VT100, VT52 screen emulation, windowing, modem control, and a pre packages multi-event programming template for quick prototyping of whatever you may have on your mind...

I haven't decided on whether or not to release the source or not...
(Mainly, the coding is so awesome it could cause heart failure...)

I would like:

For you to specify if you want to examine the C libraries, or if you wish to be a test site for an ACICS communications node.

1) If you pick the C library option, you don't need any special hardware requirements...just knowledge of C, and Turbo C.

2) If you select the ACICS test site option you must have:

1) A 4Meg ST, or TT.
2) 40 Megs of Hard Disk space minimum.
3) I would prefer an Accelerated ST..(16Mhz or more..)
But if you feel brave! Go for it with an 8Mhz machine...
4) I use the LAN on the MEGA STE for local node hookup.
If you have two or more machines....thats GREAT!
5) 2400...preferable MNP or 9600 V32,V42bis modem...
6) MINT or MultiGEM.
7) Able to write effectively, and communicate problems.
8) Not a requirement but if your in the Madison, WI area even better!

Some of the things I am doing are not ordinary. SO if you want to be a test site, be prepared to go through a set of painful upgrades.

-Gregory

I experienced the same with GCC 1.37 a while ago. I solved the problem by
renaming just gcc-cc1p.ttp to cc1plus.ttp. There is a environment variable
GCC_EXEC_PREFIX which act like an alternative prefix to all gnu cc
executables (for me it was d:\gnu\exec\). This variable is different from
GCCEXEC (which is d:\gnu\exec\gcc-).

The newest version of MiNT (0.94) comes with a new version of
BGACC.ACC that will start programs in a window on the GEM desktop. (or
any program.) I think it works really well, if I start large file copies
in the shell window, I can still do other things while the file is being
copied.

Later.......

4467. Suggestion for OS in future machines

Newsgroup: comp.sys.atari.st
Date: 1992-04-30 21:19:48 UTC
From: chang@ADELPHI-ASSB01.ARMY.MIL
Message-ID: <9204302119.AA00816@adelphi-assb01.army.mil>
Source record: 222799

Atari should write a modern multitasking OS that fully takes
advantage of the new machine. They should forsake TOS compatibility
and write the fastest, bestest, etc.

Sacrillege you say? I say no.

Instead, they should support TOS compatibility in a different way.
Being that this new machine _would_ have a kickin' hardware and efficient
multitasking OS, you would just run a GEMULATOR sort of program. Thus you
can multitask several "virtual ST's" on the new atari machine, and at the
same time you won't have to cripple the new OS and hardware to maintain
backwards compatibility (read TT ram & ST ram, and TT video).

The GEMULATOR has shown that software emulation of the is
indeed possible. Furthermore, the Atari gemulator should be easier
implement and faster than the gemulator assuming the Falcon of
whatever vaporware computer will be an '040 based machine, because the
assembly tranlation will be much simpler. Also Darek's problem with
an all software emulation (no ROMS) wouldn't be a problem coz it's an
atari program, no fuss, no muss, no _licensing problems_.

Think of it folks, 33MHZ '040, DSP, all the other goodies,
running a multitasking, virtual memory OS with no crippled
functionality to support backwards compatibility. Just double click
on the atari-gemulator, and you can bring a full speed or even faster
"virtual ST" with all the capabilities of a real one, (midi etc.,
this should also be trivial coz the 040 machine will already have
these capabilities anyways) of any flavor TOS (since it's software
only, this should be trivial). You could then run any ST program coz
you can emulate any kind of ST. You can multitask your ST's trivially
'coz the OS supports hardware protected multitasking So things that
previously took over the whole machine would have no problem, have
notator and X-OR and Calamus running at the same time!

But on top of that, you have the Lexicor Phase 12 software that
takes full advantage of the new architechture on top of that...
No one is left behind. Loyal ST users can run all their software
(they wouldn't need 2 ST's like me) and still get the latest whiz bang
stuff. New users will buy the new machine coz it modern, well
equipped device that kicks tush!

Atari might want to buy parts of gemulator. They wouldn't need
the 68000 to 386 converter. Unfortunately, the new machine probably has
been crippled already, and still won't be available until 1995 when
68040's will be used to control multimedia microwave ovens or something.

Is there anybody listening that can make a difference? I think this is a good idea. They could've made the TT a much nicer machine if they chose to support backwards compatibility with a gemulator sort of software rather than building it into the machine. I don't think it's that hard since an existing product works already -- on a different CPU yet!

Perhaps someone should suggest this on Genie where Atari People actually read messages and see if it makes any sense to them. Or will they say, "Naw, that might actually sell some computers and our tax break will be naught"

Comments, anyone?

Fo

[Stuff about emulating, and GEMulator deleted]

I think you have the right idea but the wrong method. Lots of companies are moving to implementing micro-kernals (like Mach) and building the OS on top of that. The list useing Mach is growing including NeXT and Apple. The beauty of Mach is that the kernal can dynamically load new parts and running two OS's concurrently is possible. If Atari would implement a Mach kernal and a TOS mode on top of that, they could easily implement all the bells and whistles that you want, including mulitasking, threads, virtual memory, etc, etc.

I may be wrong, but I think that the UNIX Atari purchased is written atop a Mach kernal (it is the same base one that Apple bought right?) This would make adding UNIX to your machine easier, and not interfere with running "native" programs. Apple screwed theirs up but it is possible. Considering the complexity of System 7,I think debugging the Mach version of it is going to take awhile. Atari could beat Apple to the shelf! Implementing Sys 7 features *after* doing the mach shell is easier, so Atari could rapidly add new capabilities to TOS, while still maintaining a full OS in ROM. The new features could be patched at bootup.

Considering the stength of Atari in Europe, the number of ports from the ST to the NeXT, Atari's ability to produce a portable computer, the fact that Atari is one of the three companies helping Motorola test out the 3.3V 040 (a chip just oozing "portable computer"), Atari might even get NeXT to help them iron out some of their problems. Not to mention that NeXTStep is easy to port once you have a Mach shell running. Hey for you naysayers, read Lt.Sullivan's collumn in the new NeXTWORLD. Remember Atari is one of the major players in Europe and NeXT wants European

sales. (And just where did Steve Jobs work before Apple? Atari!)

[disparaging stuff about Atari deleted]

Why don't we wait awhle and see what Atari releases before we flag them. After all, the machine is *not* late yet. It was supposed to be announced at Boston, and sold before `93. Why don't we at least give them till about September before we all run around and say Atari is fumbling the ball again! After all they are showing it to all the developers, some of which alread have one, so they are aware of what can be done with it. Heck, maybe the delay is even a wait so that hardware and software can roll out together!

It is about time to get on the case about the STBook. Is it out and for sale anywhere? I tired of just catching cameos on Arsenio Hall!

I purchased Stealth for use on my TT. I read the book in the computer store and it mentioned the TT many times. This lead me to believe that the program worked on a TT. When I got the program home and read the readme file, the first thing it stated was that it did not work on a TT. I immediately called the number listed for support and left a message. I then called for the next 3 days and left messages. On about the 6th day, I got a message on my answering machine stating that if I returned the disk, it would be updated to a version that would work on the TT in medium resolution. The message also stated the Stealth would work in ST med and hi resolutions.

Because the readme flatly stated that Stealth would not work on a TT, I never tried it. When I ran it in ST resolutions, it worked fine. I sent in my disk to be upgraded. The whole reason for buying Stealth was because I wanted a terminal program that worked in TT medium. About 11 days later, my disk came back with a note saying it had be updated free.

The first thing I read was the readme. The notice that Stealth does not work on a TT was still there. I then tried to run Stealth in TT medium... two bombs. I then tried ST Medium and high.... two bombs. I immediately called and left a message about the problem. Over the next three days I left a message every day.

I then noticed a different phone number on the return address from the envelope the disk was shipped in. I called the number and spoke to some one who said I would get a return call. I then waited 2 days and called back. This time I spoke to a lady who ask alot of questions and promised someone would call back. No one ever did. It had now be months. I could have spent that money on software from a software developer that cares about the Atari market.

I have now purchased Flash II. I had a problem with the install of Flash II. I called and left a message. I got a phone call back the next day from a very helpful person. I could tell that Missionware cares about the people that buy their software.

4474. Help! My MSA won't unpack!

Newsgroup: comp.sys.atari.st
Date: 1992-04-30 23:39:49 UTC
From: deej@cadence.com
Message-ID: <1992Apr30.233949.1997@Cadence.COM>
Source record: 222805

I recently got sound/players/audio.lzh from the Atari archive, ran
LHARC on it, and found that all that came out was audio.msa. "No problem,"
says I, "I recently downloaded archivers/msa_141.lzh recently - now I have
a chance to try that out!" So, I faithfully read the docs, noting with
dismay that MSA insists on doing its thing using the floppy drives (be much
better if it worked with the HD, no?), so, what the heck. I pop a disk in
my A drive, set MSA to run file->disk, and fire it up on audio.msa. It
finally finishes, gives me stats on the decompression, everything's cool.
EXCEPT, when I go to see what's on the disk, it freezes up the whole system!
The mouse still moves, but nothing else happens. I've tried re-formatting
the disk and re-running, but still get the same results.
Has anyone got this to run correctly? What am I doing wrong?

By the way, in case anyone else needs the answer to my post of the
other day ("I wanna make some NOISE!"), the correct answer to how to play
digitized samples is: get sound/players/digistuf.arc. It's got a good
player, a way to re-configure the keyboard click, system error vectors,
play sounds on start-up, and other stuff. How much would you pay for such
a product? Don't answer yet, because you also get several digitized
sounds, too! Now how much? You can get this incredible value for free!
What would we do without the good ol' Atari archive...

Well, I myself like Gemini, which is probebly not too much
defferent than neodesk, but it is PD, and does what I want. And is
pretty too! I cant tell you the path, but it is on 'atari.archive.unich
.edu'.
Just my two cents worth!

Or you could use MGR.... and write what you want in a desktop..

> GFA compiled programs don't run correctly under MiNT, and MiNT is
> the Kernel of new Atari MTos. Could you risk to develop a program
> in a language that won't work on the next TOS ...

Several years back I rewrote Gemdos and replaced
it with a network operating system. First I rewrote all the gemdos calls
with calls with the same "official" specifications. This ran most
programs, but GFA compiled programs broke badly. (This was through
GFA v3, I never looked at later versions) The authors depended on all
kinds of undocumented behavior. Things like assuming they would get file
handles with certain values and using them as indexes into tables, and
many other bogus assumptions. I eventually got things working, but
it was a shitload of work to duplicate both the documented and undocumented,
incidental behavior of Gemdos.

So although GFA may be a slick environment, programs compiled with it
are inherently badly behaved. (I would have given my left nut for
a GFA C interpreter, though...)

I'll just comment that I knew the programmer of STealth fairly well. For those who don't know, STealth is a renamed version of an earlier terminal program called HagTerm. If you had bad experiences with HagTerm, STealth is not much better.

I can't comment on STealth too much, but given the programmer's earlier work with HagTerm, I wouldn't recommend it. I believe both programs were written with (ick) GFA BASIC, with unoptimal code and bad memory usage all over the place. The original HagTerm used psuedo-GEM GFA graphics to produce some of the most hideous user interfaces and dialogues known to man. STealth is no better.

I've talked to the programmer in the past about my comments, but he is not very open to criticism. Last I knew, he was still a die-hard GFA junkie, and wrote the terminal programs more to say "I can do it" than to produce a quality product. You can show him bugs and talk user interface design for hours, but it won't matter. Your experiences with STealth on a TT only reenforce my experiences.

Then again, what kind of support do you expect from a teenager who attends one summer class at a local college and parlays that into "<the developer> is a 16-year-old college student"???

--R.J.
B-)

P.S. Back to the original thread -- I used to be a die-hard Flash! user, but now I'm using STalker and STeno and I love them. User-friendly, very consistent, small and optimal. Highly recommended.

Nope, Gemini is very different from NeoDesk. One of the main features of Gemini
is (IMHO) the built-in shell (Mupfel) - and that *is* a big difference. In
Gemini you can do batch-file processing, etc (all the normal shell-stuff).
And if you don't like shells: Gemini offers a full-featured desktop
replacement, with almost all the possibilities you always wanted the standard
desktop to have...
In general Gemini is a lot more interesting thatn NEoDesk (still IMHO of
course).

Which version of Lattice was that, and what exactly was going wrong? I've got
a lot of really hairy structure stuff in my code, and I haven't had any problem
with it from Lattice. If its a version before 5, then its not evenly remotely
related to the current version (except in name), as Hisoft completely rewrote
the whole package.

True, but very wrong as well. C has *no* support for a particular machine's
features. All such support is provided by libraries. However, since C lets
you write very low level code if you need to, I think its fair to say that
C with suitable libraries gives you at least as much support for your machines
special features as any other language can.

```
Selling ATARI 520ST system:

System Includes:

- 2 external disk drives (1 double sided, 1 single sided)
- 14 inch colour monitor
- mouse and two joysticks
- 520ST computer with keyboard
- Bunch or software
- manuals
- power supplies

Price: $320US + S&H.

Contact: Darren Keyes (613) 763-7569
I don't have E-mail access!!!

Just a guess, but perhaps Mint doesn't like code that executes outside the TEXT segment - I assume that this would be the case with the packed program. The packed executable is initially in the Data segment. Do any other packed programs cause problems?

As you mentioned yourself, HiSoft had nothing to do with Lattice V3,
so using it the basis of a complaint against them seem's to me to be
somewhat unjustified.

> Lattice C seems unable to produce very compact code for "small"
>compilations - a very important consideration since most uses of C is
>precisely of this type.

You did choose the optimization based on minimal space, didn't you,
as ISTR that the default is either no optimization or optimizing for
speed of execution.

> Sozobon beats it - but the best is (still) Mark
>Williams C. Now there's a "C" that was developed by real "experts" - what
>a pity they have moved away from the ST-scene. If they had continued to
>update their Libraries to cater for the 68010 and 68030 etc., no other
>"C" I've used would have a look-in!

Quite possibly but HiSoft are still updating and supporting their
product _now_ and _do_ support the range of 680x0 processors. YOU may
have a problem with someone who handled your support call but what
support can you get for MWC now?

> My advice to anyone beginning with C would be to get a package that
>is marketed by the people that developed it FROM THE START. For such a company
>the expertise would be there - and "software support" would not be a public
>relations excercise but a "breeze" with precise succinct answers quickly
>forthcoming from the developers themselves.

I believe that the person that you had a problem with was a developer,
although possibly not of the product that you were inquiring about.

4495. Gemfast 1.8 wanted

Newsgroup: comp.sys.atari.st
Date: 1992-05-01 14:04:40 UTC
From: rlw@ukc.ac.uk
Message-ID: <803@eagle.ukc.ac.uk>
Source record: 222826
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Having just read the lastest STreport, I have read about Gemfast v1.8
with quite a few advantages over the old Gemfasts.

The question is, can I get hold of it over the Internet yet? I have just
tried a.a.umich.edu and I could not find it there.

I would really like to get hold of it before the weekend starts if possible,
so come on, someone out there must know.

Cheers - Dick

I have been looking for some time for a file that might
explain what the difference is between all the files used in tex.
e.g. what's the correlation/difference between pk libs, metafont
stuff. What are formats, e.g. latex.fmt/plain.fmt etc.

Is there a doc file that explains all?

Source record: 222830

Don't go do something stupid like getting a clone! You'll be
doing yourself a terrible disservice! Just because you're experiencing
Dealer-Dipsh!tness.

I've found from personal experience that to find a GOOD dealer,
you must go mail order. I buy all my hardware from Computer STudio
in Asheville, North Carolina. I don't have his 800 number handy,
but you can probably get it from the 800 directory.

On the subject of Megafile 44's, unless you really want that
case, you can do better at a cheaper price. Get yourself a
standard shoebox case with power supply ($75), an ICD host
adapter ($75), and a Syquest 44 meg drive ($325). Or, get
the Syquest 88 meg drive ($409). In the end, it's cheaper
than the Megafile, and there's room to add a real hard drive in
the same case! The prices I quoted on the Syquests (the same
mechanism as in the Megafile), are from ComputAbility, at
800-558-0003.

I tried to buy my Mega STE from a local dealer. Well, local as
in 100 miles from here. They jerked me around the whole time,
and as it turns out, they gave me a machine that they KNEW was
defective. I took it back and bought from Computer STudio.

Hope this helps.

4500. Suggestion for OS in future machines, A FURTHER SUGGESTION

Newsgroup: comp.sys.atari.st
Date: 1992-05-01 14:58:16 UTC
From: chang@ADELPHI-ASSB01.ARMY.MIL
Message-ID: <9205011458.AA01138@adelphi-assb01.army.mil>
Source record: 222831

I was just thinking, after speaking at length with a contractor
who has a Color NeXT at home (he does a lot of work at home == double
productivity, he's got a saying "Have disk, will travel").

Maybe those Atari/NeXT rumors aren't a bad idea.

Run a modified version of NeXT step on the new machine, and have
an atari gemulator as a bundled application.

But NeXt step is slooooowww you say. Apparently, Bart
(aforementioned contractor) who works on sparcs (which BTW are NOT
slow) when not at home, sez the New NeXT (all color NeXT's are new,
his was just bought in the last 6 months) is not slow, so twixt the
'040 and the latest version of the OS, those NeXT guys must be doing
something right. I figure off the cuff (I may be way off) the
mythical stats of the Falcon and the NeXT are not too far off,
'040, DSP, ...

Now let's look at the benefits.

o NeXT step exists, on a Motorala platform yet.
o It IS portable (of course, it's an object oriented system written on Unix)
o There is an Intel version == there are people who know how to port it to different
architectures, and NeXT licenses it.
o It's Unix == long history of multitasking and virtual memory. Huge
amounts of things you can get for unix for FREE.... Xapplications, gnu stuff
(tho they already exist on the next), etc.
o It's pointy clicky, neato keen multimedia integrated slick
GUI, you don't have to know anything about unix or even computers to
use it.
o There are already applications (good ones yet) for NeXT
step. How many people have written stuff exclusive for the TT --
powerful machine, nothing that takes advantage of it. They've got
Word Perfect, Lotus for NeXT already.

A lot of headway has been done for both NeXT step and the gemulator.
For the technical part of things, Atari would have to do that much work,
Do the machine specific port of NeXT step, do the machine specific port of
Gemulator. Of course they need to go thru the details of licensing/buying
the software/rights, etc.

So what say, Atari? Perhaps this is what they are actually doing,
which is why the machines are so hush hush, they just intend to surprise
the world..... NOT!

Fo

4501. HELP: SC1224 => VGA/CGA ?

>in a language that won't work on the next TOS which is due to be
>released in 4 months (Atari Fair in Duesseldorf/Germany) when the
>manufacturer of the programming language you use doesn't support
>the ST's any more???

Doggone it, once and for all, Benedikt, GFA has NOT, I repeat, _NOT_ stopped supporting the Atari ST/TT computer! Sheesh, I'm getting tired of fighting this (sounds to me like a "flame-in-disguise" by an insecure C fanatic). ;-)

ST Format (?) magazine is publishing an earlier or crippled version of GFA BASIC 3.x as a ploy to boost sales of the product in Europe, NOT because they are dropping the Atari. They did the same thing a while back with GFA RayTrace and their sales increased 300%. Can you blame them for trying again?

True, GFA Keil (one of the German GFA outlets) was _restructured_, but GFA Systemtechnik (the home office) and GFA Data Media (the UK office) and GFA SOftware Technologies (the US outlet) are still alive and well and selling product and making money in the Atari camp, thank you very much!

And do you know WHY compiled GFA programs don't run under MiNT? It's for the same reason some don't run under TOS 2.06. The MENU.PRG compiler frontend simply assigns too little RESERVE memory (or so I was told by the Codeheads, and I reckon they ought to know). Any user can easily change that NOW but even that won't be necessary when version 3.7 hits the streets (I've recently been signed up as a GFA 3.7 beta tester).

And if you honestly believe that MultiTOS will be available to the end user in 4 months, you are indeed a wonder of wonder amongst eternal optimists. Sure, we will get MultiTOS eventually, perhaps even this year, but there are a lot of "minor" details to be worked out first... like if it's even going to be made available for existing machines or not. And _most_ of our currently popular programming languages are going to need some minor tweaks to work properly with Atari's new 68030 Falcon machines <shhhhhh! that's a secret!> And does anyone out there remember when Apple first release MultiFinder? Remember what we, the users, called it? ... MultiCrasher! Yep, there are a _lot_ of little details to be worked out in a new multitasking OS (but MiNT

sure was a good place to start!).

Hey... if you don't like GFA for whatever reason, that's OK and your business. But spreading false rumors such as these is dangerous and NOT appreciated! Please double-check your sources... I double-checked MINE!!!

USA users may call GFA Software Technologies at 1-800-766-6GFA to confirm or deny any of the above. UK Users may wish to ring GFA Data Media at (0734) 794941. Sorry, I don't have the Germany numbers handy.

>It's called 'Atari ST Review'. It's not bad for a first edition, but it's got
>a long way to go before it becomes as good as St Format

I agree that it lacks polish, but on the whole I thought it was just as good as ST Format, if not slightly better. It has an excellent balance of serious and leisure coverage, plenty of detailed articles (Format always promises a lot but rarely seems to squeeze much information in between the illustrations). The reviews were comprehensive and didn't descend to the cenceit or childishness which ruins many Format articles (especially the games). Hopefully it might give Format a run for its money and cut their smugness. I must admit, though, that the cover disks were pretty feeble, whears Format is especially strong on this at the moment. Review at ₯1.75 and no disks would be ideal !

Sam.

I upgraded from Lattice C V3 to V5, and the two products bear absolutely no
relation to each other in anything but the name. There is not a single
part or aspect of V3 carried over to V5 except the name and the Lattice way of
compiling to intermedate code first.
Knife ST was, in my understanding, completely developed by somebody else and
Hisoft only market it, so they might not know too much about it.

>
> Lattice C seems unable to produce very compact code for "small"
>compilations - a very important consideration since most uses of C is

Bollocks! You can have programs of a few hundred bytes (Although you had to
write your own startup code in V3 to get below 3 or 4K)

This does NOT sound like the HiSoft I've been familiar with for the last 6 or 7 years, I'm quite surprised. HiSoft does support for its products on BIX (a commercial service like GEnie, Delphi, et. al.) and they have always bent over backwards to help folks there, even folks who are not registered product owners.

I'm going to post a couple of these messages on BIX and see what HiSoft's response is. Given my experience with Alex, Dave, and the rest of the HiSoft crew, I'm optimistic that it all may be a misunderstanding.

> get a [c compiler] that is marketed by the people who developed it
> from the start

Well, that locks out sozobon v1.33/HSC -- I certainly didn't develop it from the start. But, I do have a commitment to ongoing support for it. Even though HiSoft didn't originally write Lattice C, I have no doubts about their technical knowledge of it and their ability to support it.

>

I am not surprised.

This is the kind of thing that happens when too many people
get their finger in the pie and new versions come out every other
day.

If any "lzh" programmer sees this, I suggest that you slow down
the pace of releases, (not necessarily development), so that the
rest of the world can catch up. When you make a release, make
sure that your software is distributed widely enough so that the
rest of the world can get it.

One of the advantages of ARC, ZOO, and ZIP is that they are more or
less the same and compatible across a wide range of hardware, including
Ataris, Unix systems, and even lowly PCs.

The 65C02 in the Lynx is running at 4 MHz. I belive the
Macintosh IIfx uses a 10 MHz 6502 for some kind of IO processing.
That's the fastest I've heard of--a 10 MHz 6502 would be
pretty darn fast, considering how few cycles it needs
to execute instructions (between 2 and 7, I believe).

Of course this has nothing to do with the ST...

Talk about been feeble, did you read the NVDI/Quick ST comparision. Now
if I'm not mistaken these programs are mean't to speed up screen drawing
etc. but nowhere in the comparisons did they give any speed advantage
statistics! I think they've go a long way to go before I'll take out
a subscription, anyway 4 quid for a mag, that's 50 quid per year,
even the Economist is not that expensive! (Well almost). I think if they
took off those bl**dy cover disks and sold the mag for 1.75 then I would
think differently. Did you know that the German mag ST Computer only costs
30 quid for one year!

> Has anyone got this to run correctly? What am I doing wrong?

It's also a demo. You better have a color monitor and it better sync
up at 50Hz to get anything. The disk takes over the system
completely, as is usual for demos and you can't keep it on your hard
disk because of all the floppy specific stuff happening (code is
loaded to speed up floppy access and typically decompression is also
going on while a pretty startup scrolling screen is running). Net
result, if somebody used MSA or CDC, it's there for a reason, resign
yourself to forgetting your hard drive (turn it off if possible) for
such demos.

4516. MultiGem Blues

Newsgroup: comp.sys.atari.st
Date: 1992-05-01 21:28:35 UTC
From: bill@sugaree.uu.net
Message-ID: <1992May1.172835.5@sugaree.uu.net>
Source record: 222847

Hi all,

Is anyone using NeoDesK and MultiGem together...if so
what's the trick??

Short review of MultiGem follows...

I have a 520ST running TOS 1.4, 2.5MB RAM, a 30MB hard drive, and two
floppy drives (one single and one double sided) so memory and space
are not problems. In one evening of installing and using MultiGem
with my software, which I have alot of, I found that MultiGem did not
work successfully with most packages I have.

Some examples:

I'm using Wordflair II with G+Plus, selected fonts are supposed to load
up from an ASSIGN.SYS file when I startup the program - this causes the
system to crash if MultiGem is running.

When using Interlink ST (communications) the software starts up and runs
fine but when I tried to switch to and from the desktop the menu bar is
switched, but the background is not. This means that I have no access
to my desktop (floppy drive and hard disk partitions), and have to reboot
the machine.

This is just a sample of the many, many times I found that I could not
use the MultiGem environment. I think the idea and purpose is good...
god knows it's about time we had a multi-tasking environment for the Atari
ST, STe, and TT, but only if it works and works well. Personally I found
too many problems to make it worthwhile.

Source record: 222850

Has anyone had experience (positive or negative) using the Cubase sequencer with a third-party accelerator (such as Fast Technology, Dave Small's SST, etc.)?

Also, it sounds like for Cubase to work at > 8Mhz, the memory cache has to be disabled. How crippling would that to be to any speedup which would otherwise be gained from the accelerator?

Thanks.

- Glenn

>Hey, I might not agree with everything Greg had to say, but I
>will NOT tolerate having him censored just because some people
^^^^^^^^ not true (I hope)
>whined to the net-police. If the net adminstrators really have
^^^^^^^^^^^^^^^^^ no, his Univ. Admins
>shut him up, I want a word with them. Whom do I contact? I'm serious.
^^^^^^^^^^^ no, just politely _ask_ him to cool down a bit.

From what I know, Mr. Carter's system Administrators (at his University) only asked Gregory to have a little more consideration towards his fellow netters. They would not censor anyone, but most likely remove posting priviledges from _all_ students if they abuse News. I guess that Gregory will keep posting here, dont worry. Simply less articles such as #38885 in comp.sys.atari.st. Greg must care?? ^^^^

Now I digress, what if someone were to post a dozen articles (say right here), containing nothing but nonsense, with hardly any message to put across, then following-themself-up telling themself how much they agree. (say, does that remind you of anyone? ;-) Well, we're allowed, just as much as the person who posts these articles, to inform the admins about the user's behaviour. And they can (being reasonable) _only ask_ the individual(s) to relax a bit. Posting is often a priviledge students in many Universities cannot have, and for many, they are given access to News for academic purposes. Think about it.

Back to Greg. C., No one (that I know of, at least) wants to CENSOR him just to get him to try and understand some of the concepts proposed in news.announce.newusers, perhaps, and to cut down on some of the articles containing little meaning. His opinions are welcome, that is why "kill files" were invented.

Although on the other hand, perhaps you may want to look into the dissapearance of a certain Gregory Miller (A.k.a. "England").

P.s. This is not a flame.
>--
>Ciao-abunga! +-------------------------------------+
>Michael Park | This space intentionally left blank |
>mpark@u.washington.edu +-------------------------------------+

Now that that is over with, I'd like to comment on the article (was it 39130?) that gave the specs about the Falcon (the one that says it is official from Atari, Feb '92):

It must be too good to be true! All that stuff, in a low-cost machine? 1992?
I am a _tiny bit_ dissapointed from the lack of a high-rez (like 1024x768)
mode (even in 16 colors), but gee, it sounds like one great home computer.

I hope there will be lots of them at the Atari Messe this summer.

4524. MultiTOS

Newsgroup: comp.sys.atari.st
Date: 1992-05-02 06:39:40 UTC
From: steve@thelake.mn.org
Message-ID: <A217323682@thelake.mn.org>
Source record: 222705

There has been a lot of speculation about whether Atari will provide for running MultiTOS on a 68000. In its premiere issue, Atari Explorer Online says MultiTOS will be made available in some form for all ST systems, and attributes the information to Jack Tramiel.

On a system with a hardware memory manager unit (MMU), MultiTOS will provide for running programs in protected memory.

The article says that a portion of MultiTOS will be built into ROM on future Atari computers, but the bulk of the operating system will be loaded into RAM.

4526. Overdose demo

Newsgroup: comp.sys.atari.st
Date: 1992-05-02 07:13:55 UTC
From: tmo@tolsun.oulu.fi
Message-ID: <1992May2.071355.462@ousrvr.oulu.fi>
Source record: 222707

Hi!

I just uploaded a brand new "Overdose" demo to atari.archive.umich.edu. This demo was ranked second in a demo competition which was held during Mega Leif Convention in Sweden last month. This one includes great ProTracker music and graphics with 32 colours on screen (a bit flickering though). Oh, it runs in 50 Hz only! I hope it will be available in /atari/demos directory soon...

Greets, T.M.

4527. Mint094 bug (on /proc), and a request for a bourne shell

Newsgroup: comp.sys.atari.st
Date: 1992-05-02 08:33:25 UTC
From: muts@fysap.fys.ruu.nl
Message-ID: <MUTS.92May2103324@fysap.fys.ruu.nl>
Source record: 222708

On /proc, and also programs like ps and top, give for all processes in Mint094 (unlike previous versions) the same process name, e.g. bash. I guess this is a bug. Does everyone have it, and will it be fixed?

Secondly, for makefiles that spawn shells, because of memory problems I'd like to have a minimal, but fully compatible bourne shell. I tried to compile BSD's sh, but it crashed and I have no decent debugger yet. Did anyone compile a good bourne shell?

>
>... which just goes to show that tabloid newspapers are never going to
>go out of style.
Which goes to show that most Americans do not know English, and wouldn't use a dictionary if they knew how. Znet is a conservative, Atari supported mag which generally prints less falicies than ST-Report. ST-Report is a sensational (neg.) speculating mag which predicts both more and less accurately than Z-Net. Neither is a tabloid, since a tabloid denotes a paper which is folded once across, like the Sun, Newsday, or The New York Post, as opposed to folded once accross and then from top to bottom, like the New York Times or the Wall ST Journal (the paper that tabloids are made from is half the size from top to bottom than that of broadsheets). Both ST-Report and Znet are an entirely different format entirely, that of an online magazine (which is folded weirdly, being compressed). [no, this isn't a spelling flame; this is an English flame.]

It is very commendable that you feel this way!! - But surely you cannot possibly have the committment that would be incumbent on you were you charging for your program!! (By the way congratulations for your "Heat'n Serve" Sozobon 1.33 - I've installed it instead of version 1.2 (in preference to Sozobon 2.0) and so far it's served me very well indeed. As I said initially, though, I tend to use MWC mostly (it has a slight edge on Sozobon (with minimum.h) for small compact executables compiled with their -ncrtsg0 option, and I sometimes need to use their Resource Editor or RESDECOM. One minor fault of MWC (Sozobon is fine on this) is the "extreme" slowness of their fscanf() and scanf() functions. They must be missing out on some trick in their atof() routines (presumably). However it is nice to have genuine "doubles" - any plans for these in a future Sozobon?).

>Even though HiSoft didn't originally write Lattice C, I have no doubts
>about their technical knowledge of it and their ability to support it.
>
>- Ian
><Biased toward Bullwinkle cartoons>

I'm sorry but I do!! - at least at the level of expertise that the Mark Williams C developers would be capable. When the latter Company "signed off" from the ST scene, as you probably know they offered the entire source code of their C compiler and Libraries for sale to registered users. Armed with this (and also, of course, the original Sozobon sources) as prototypes it should not be too difficult for any competent computer scientist (with the requisite time) to maintain a level of support and indeed get ideas and improve on their own code in many ways. But true "support" goes beyond this and involves innovations. Correct me if I'm wrong - but I have not really heard of any genuinely NEW features in Lattice C5. In fact, they appear to be struggling to get out a C-source Debugger - introduced by MWC for the ST so many years ago.

I remain unconvinced that I should fork out any more money on upgrading Lattice C5. (I quite fancy exploring "Pure C" though).

Cheers, W. Alan B. Evans

> bottom than that of broadsheets). Both ST-Report and Znet are an entirely
> different format entirely, that of an online magazine (which is folded weirdly,
> being compressed). [no, this isn't a spelling flame; this is an English flame.]

It is an unwarranted flame. ``Tabloid'' originally was a trademark for a
small tablet of medicine. The word has been applied to small-format
newspapers for decades, and is commonly used in a pejorative sense to
describe any sort of journalism that is cheap and sensational. The
description ``tabloid television'' is applied to news-as-entertainment TV
shows such as ``Hard Copy'' and Geraldo Rivera's ``Now It Can Be Told,''
neither of which can be folded and carried onto the subway.

Incidentally, tabloid and broadsheet newspapers actually are printed on
the same size paper. A single press unit, fed by one roll of newsprint,
can print up to 16 broadsheet or 32 tab pages. The web is combined with
those from other units, then slit into pages and folded at the end of the
process.

|> The article says that a portion of MultiTOS will be built into ROM on
|> future Atari computers, but the bulk of the operating system will be
|> loaded into RAM.

Yippee! I have been waiting for that for a long time. ROM based OSes have their advantages, but I feel they are greatly outweighed by the benefits of a loadable OS: easy upgrades, patches, minor improvements, etc.

For example, the Apple system was not that much more advanced than TOS when it came out, but the disk based OS has led to innumerable extensions that became immediately available to all users. When all users have access to current versions of the OS, vendors support that latest version. There just don't exist programs in the mac world that have the incompatibilities we have. You just don't hear the analog of " Program XXX won't run on TOS 1.6" More importantly, releasing frequent, free upgrades (freely distributable so there are no costs above development costs) makes for happy users== increased hardware sales.

I won't even try to count the number of times my Apple System file has been upgraded. It is certainly no less than ten times since 1985. On the other hand, Atari has only released about four versions of TOS, and I am still running 1.0.

If this is true about RAM based OS, way to go Atari! Now you're on the right track.

By the way, the recent post about Falcon specs does indeed sound to good to be true--especially the price and sound parts. Beware that this may just be a vapor-post, designed to see how excited he can get us. Maybe even an evil Amiga user trying to get a thrill. (note: last comment does not imply amiga users are evil.)

^^^^^^^^

Mayhap you mean fallacies? So, which is it with you? You know how to use a dictionary but won't, or is it you just don't know how?

Posts like this really crack me up. This is the second time in two days that someone has criticized another's spelling or grammar, while simultaneously demonstrating their own ineptitude.

Yesterday's example was Gregory Carter's post where he requested beta-testers but required that they be competent writers. Unfortunately, his post was filled with the usual excessive and incorrect use of apostrophes and commas. Very amusing indeed (yes I know this is not a complete sentence).

By now you are each probably searching my post for errors. God help me if you find one, for I'd never live it down.

4545. Atari MegaFile 30 Hard drive For Sale

Newsgroup: comp.sys.atari.st
Date: 1992-05-02 19:47:25 UTC
From: jbleaza%peruvian.utah.edu@cs.utah.edu
Message-ID: <1992May2.134725.638@hellgate.utah.edu>
Source record: 222726
Cross-posted to: comp.sys.atari.st,misc.forsale.computers

I have a used MegaFile 30 that I would like to sell.
I'm not sure how old it is, but I've had it almost a year and a half,
and I've never had any problems with it. (Except those I've created
myself by messing around trying to undelete files :-(.)
I would like to get $300 for it. Before you tell me I'm crazy,
consider this:
It has a Seagate ST-238R inside, which goes for about $180 new and
$125 refurbished in Computer Shopper. You can't get an external hard
drive case with power for less than about $50 (believe me, I just
bought one). I don't know how much an RLL interface for the Atari is,
but I just bought a SCSI for $140. Of course, RLL is quite a bit less
expensive. Also, I'm not going to bother to format the drive (don't
worry -- it's just full of shareware. I don't believe in commercial
fat corporate software. :-))
Of course, I would LIKE to get $300. Make me a reasonable offer.
I might also trade for Atari-compatible hardware. (Especially an
external 9600 baud modem)

Thanks,
-- Jaysan
(jbleaza@peruvian.utah.edu)

I think this is correct. There is a 6.0.7 startup file (INIT) that
was in the system 7 distribution which provides TrueType functionality.

Ah! That's why the Amiga has such a stable and nice to use operating system, while the Archimedes' is so crude and bug ridden :-).

The fact that TOS is currently in ROM means that the computer is usable without a hard disk drive, unlike PCs and Macs.
I don't understand why Atari can't put the whole of MultiTOS in ROM and have documented jump table containing the address of every function, and documented internal variables that the functions use. That way any bugs could be fixed by a very small program that just changed the address in the jump table to its own code.
While it is currently possible to fix bugs in this way,
a) The lack of a documented jump table in RAM for each TRAP function means that a trap handler has to be written that checks to see whether the function number is the one it is handling and call the old TRAP handler otherwise. This is ineffecient (Tracing through a Gemdos call on my machine you have to go through about 5 of these (all badly written) before you get into ROM).
b) If you wanted to fix the tinyest of bugs in, say Fopen, you would have to replace the entire file handling section of GEMDOS because you don't know where the file desciptor structures are held (unless you disassemble the whole thing and rely on the address not moving).

>For example, the Apple system was not that much more advanced than TOS
>when it came out, but the disk based OS has led to innumerable extensions
>that became immediately available to all users. When all users have access

That is because Apple are a bigger company with more development money (which wasn't spent on projects like the Abaq).

>to current versions of the OS, vendors support that latest version. There
>just don't exist programs in the mac world that have the incompatibilities
>we have. You just don't hear the analog of " Program XXX won't run on TOS

That's not what I have heard, especially with MultiFinder.

>1.6" More importantly, releasing frequent, free upgrades (freely distributable

My catch-all answer to the compiler argument:
Write programs in whatever you can write in. If I, the user, use the program and say something like "Hey, this program is stupid because it's in GFA", or somesuch, then there is a problem. Otherwise, If I can't tell what language it's written in, it doesn't matter - if you prefer to program in PiLOT or LOGO or even COBOL, that's fine with me, as long as I can't tell.

4551. good ST mod player needed. I mean _good_

I would like if anyone could perhaps e-mail be a copy of a .mod player?
the ones I have ftped from AArchive hardly work at all.
cdplayer- corrupted archive
dplay- the one in the background, it only lasts 60 secs.
replay 1.5- great, but doesn't slow down music when playing amiga mods.
digicomp.prg- digicomposer, runs amiga mods right, but only works from a:drive
locks up when drive changed.
Audio sculpture- its msa. not a file.
tracker.prg- the speaker just gives an annoying buzz all the time when the
program is running.

what I would like to have is a DA or mod player that plays mods at the
correct speed, that calls the fileselector, not there own buggy non standard
one. PLEASE SAY ONE EXISTS!

Thank you atari-land!

Go have a look at the A5000 Archemides by Acorn that has 2 Megs bytes
of Rom OS...

Mind you it does have lots of built in features, like pain program
text editor etc...

Source record: 222734

Yeah, it does work - but on my set-up (832K mode to an ImageWriter I) it takes forever to print a page. I did it one night out of curiosity. It did a good job of getting a lot prettier print out of a very old printer. But the time it took... Now maybe if I had a 12MB SST, '030, etc...

Other downer is that Spectre can't support 6.0.7 sound, unlike 6.0.5. I had it on its own little partition for a while, but I hardly ever used it, so I got rid of it. The Uni has so many Lasers for GOOD printing. Maybe when I leave Uni, I'll put up with how long it takes.

PS My 6.0.7 was a minimal installation, which had been further gutted with ResEdit - the fonts take up a lot of system space.

Hope this helps with your decision.

Yes, the old version of matlab (ie. the non-commercial version).
It is uploaded to the atari.archive, look for matlab.zoo in in the
applications/math
directory. It is complete with source in BC-fortran, it is compiled for
min. 2 Meg,
but it should be a small job to modify it to run on 1 Meg, instructions
are included.

Even on a Mac TrueType is slow. And I don't mean a PLUS! If you need it, use
Adobe Type Manager, which is supposedly available in the USA from apple dealers
for a nominal fee. In Europe however... :-(
If you do this, you won't have to hassle with non-standard fonts, creating
documents that even on a 16ppm 32 MB RISC-based PostScript printer take forever
to print - you'll have real PostScript instead.
Another bonus: you can determine yourself how much memory the font scaling
system will use; give it much and it'll be blazingly fast, give it little and
the speed will collapse (although at any rate it's better than TrueType
anyway).

The TrueType init will work with System 6.05 too, in my experience. But why
bother...

>PS My 6.0.7 was a minimal installation, which had been further gutted with

There is no Font/DA Mover for nothing. Version 4.1 will handle TrueType fonts.

Every indication from Atari Corp. has been that the ROMs will
continue to provide a functional single-tasking operating system for
entry-level users. MultiTOS is being described as a disk-loaded
upgrade that takes advantage of ``hooks'' in the basic ROMs, much as
GDOS and FSM-GDOS do.

If you don't have sufficient disk and RAM space for the multitasking
TOS extensions, you probably should not be messing with more than one
program at a time anyway.

I don't see how the availability of a disk-based, multitasking TOS
upgrade would deter entry-level buyers. On the contrary, an upgrade
path is a good thing.

Of course, there is going to be software that won't run on basic
machines. We already have a lot of that. You can't run Cranach in
512K of memory. You can't even run PageStream on a single-floppy
system (without losing your mind). That doesn't devalue the small
machines, it just raises the value of memory and hard drive upgrades.

4560. Problems compiling GNU make 3.60

Newsgroup: comp.sys.atari.st
Date: 1992-05-03 16:08:46 UTC
From: wenzel@marsu.tynet.sub.org
Message-ID: <H.EiZ1QAjXbCw@marsu.tynet.sub.org>
Source record: 222739
Cross-posted to: comp.sys.atari.st,de.comp.sys.st

Hello!

I got the sources for GNU make 3.60, already changed for compilation
on the ST by Roland McGrath.

I tried to compile it on my TT using GCC 2.1, GNU libs+includes
patchlevel 79, MiNT 0.94 and tcsh.

The result of the compilation has one major problem: gmake does not
find any program located somewhere in the path. Thus, I patched
job.c for my own setup as following:

```
/* Default path to search for executables. */
#ifdef atarist
static char default_path[] = ";d:/usr/bin/gcc21;e:/bin;d:/usr/bin";
#else
static char default_path[] = ":/usr/bin/gcc21/:/bin:/d/usr/bin";
#endif

/* Default shell to use. */
char default_shell[] = "/bin/sh";
```

It had no effect concerning this problem. If you add complete pathnames
to any program used in the makefile, gmake runs just fine.
If gmake tries to open a new shell via 'execvp', my tcsh is not
found, despite using a SHELL environment variable and having a
copy of tcsh.prg as '/bin/sh' (/bin is given by a symbolic link).

Another 'feature' is that you have to execute 'gmake -f makefile',
otherwise the makefile is not found in the current directory.

Any suggestions showing gmake the correct paths?

Regards, Markus.

4562. Can YOU digitize? Please help.

Newsgroup: comp.sys.atari.st
Date: 1992-05-03 16:34:25 UTC
From: an172@cleveland.Freenet.Edu
Message-ID: <1992May3.163425.228@usenet.ins.cwru.edu>
Source record: 222743

Hello everyone!

I have the ST-Replay cartridge from Microdeal, and I have been trying to mix some songs I have. I have never had to tape the output from the cartridge before, so I really didn't worry about the quality of the sound much, as it always sounded pretty good coming from the monitors speaker.

To mix the songs, I am digitizing the output from a portable CD player which has two outputs, a headphone port, and a line out port (with a cable that converts it into two rca style jacks). I have hooked the two rca jacks to the replay cartridge's single input jack by using a two female to one male y-jack. (Is there any problem with this?)

I digitize the sound using a speed of 20Khz... I think this would be a high enough quality for the sound I am using. When I use the monitor function, and have the output going through the ST-Replay cartridge, the sound sounds so-so. I can hear noise, and the output is far from what the original sounded like. I am using normal (not gold) rca patch cables (with extensions).... Would this be a cause of some my problems?

I had hoped that using the output from my CD player would clean my digitized sound up a bit, but for some reason I can never get digitized sounds as good as the sounds you might find on a local bbs, or on atari.archive...

If you have ANY suggestions, please e-mail me!

Thanks in advance!

>sounds as good as the sounds you might find on a local bbs, or on
>atari.archive...

The main thing you need to do to guarantee reasonable sound quality is find the maximum amplitude that doesn't clip the sound. In other words, make it loud enough to clip (make the wave flat at the top and/or bottom), and then cut the volume down until right when it stops clipping. (NOTE: If it's not tedious, you're not doing it right. Getting a few clean samples for a game usually takes me several days, and when I'm done I'm still not happy with most of them.)

The other thing is that the output from your CD player's RCA outputs might not be "loud" enough for the digitizer. Try using the headphone out; with that you can adjust the volume with the CD player instead of with the digitizer. (When digitizers have input volume controls at all, they're usually pretty crummy.) WARNING: If you use the headphone out, make sure you put the volume back to normal when you're done. Slapping on headphones and hearing your favorite song played at "7" out of "10" volume is NOT fun or healthy. Most headphone outs can go WAY too loud for personal use.

Finally, the sound quality depends a lot on what you're sampling. Some of the sounds I wanted to use for Blox (one Nine Inch Nails sample in particular) just could NOT be made to sound good at 20kHz/8 bits, much less at the 11kHz I needed for the game sounds. It depends very much on the dominant frequency components; in general mid-range sounds come out better than very high or low sounds. (The latter just because most D/A's seem to attenuate the bass for some reason.)

Some digitizer software programs have a "maximixe amplitude" operation. I applied this to most of the atari.archive sounds because it often dramatically increases the SN ratio. If you have such a feature, try it; it usually improves the sound quality.

I have a feeling (for the last year) that the reason behind Atari
not pushing the STs, delivering the TTs, or pushing hardware for them
is because of the new systems they are planning to release.

Why should Atari PUSH its STs when they think they can offer people
more in the next few months?

Why deliver the TT/030 when this machine may be obsolete in several
months?

It is probably safe to say that Atari will be releasing some new
high-tech hardware as well. Would you rather have the Megafile 44
or a hard drive that is faster and larger for less?

I really don't think that Atari has given up. I think Atari has something
fantastic in store for us.

I am not making any new major hardware purchases until September, 1992.

I would advise everyone doing the same.

Len

P.S. If you really want a hard drive, why not consider a third-party
hard drive?

Isn't it already?

>
>It is probably safe to say that Atari will be releasing some new
>high-tech hardware as well. Would you rather have the Megafile 44
>or a hard drive that is faster and larger for less?

Seriously though, I can't see any major advances in hard disk technology over the next few months. If you want the latest in removable media try the 600Mb rewritable optical drive (1200 pounds + 30 something per disk).

>
>I really don't think that Atari has given up. I think Atari has something
>fantastic in store for us.

Get real man (as I am led to believe all you Americans say).

>
>I am not making any new major hardware purchases until September, 1992.

Again, seriously - I have been delaying upgrading my ST for two or three years now - first I thought I would get an STe (But didn't because of the DMA problem), then I heard about the Mega STe and decided to get one of those (But didn't because they are overpriced by at least 150 pounds). A couple of months ago I read about a cheaper version of the Falcon that was going to have a 16MHz 68030 and be available by Christmas for less than 400 pounds (but Atari have now put the release date right back). Now I am thinking of getting a 2Mb memory upgrade until Atari get their act together (In SIMM form so I can use the chips in whatever machine I buy next).

>
>I would advise everyone doing the same.

Probably good advice, but in my case I am likely to end up spending the money on a something else in the mean time.

>
>
>Len
>
>P.S. If you really want a hard drive, why not consider a third-party
>hard drive?

In Europe hardly anybody buys the offical Atari hard drives. Protar seem to be making the best value for money ones at the moment.

Michael,
I could not agree MORE! What Roger should have also mentioned it is
a "TURBO" verses "FoReM" (both BBS's) war, with aposing sides.

Also as a parting point it is _great_ to have Bob Brodie on FNET.
If you have a question you can go straight to the horses mouth on
that network. As you maybe aware Atari INC.(USA) are internet and
take these feeds and you can send them email as well, so we can do
it on this network.

Happy Days..

Bob,
There is PDN access and GEnie can be accessed from there (PDN).
The closest I have used GEnie to Saudi is London and Hong Kong.

Good luck with the new venture.

4570. Spectre 128 on TT

Newsgroup: comp.sys.atari.st
Date: 1992-05-03 22:05:51 UTC
From: sander@krazykat.engin.umich.edu
Message-ID: <#px+7J#@engin.umich.edu>
Source record: 222651
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I just bought one, runs great on my TT. The problem I am having, however, is porting Mac applications to the darned thing.
I have AccessPC, which works fine for documents, but the applications and their resource forks seem to mess it up. This would not be a problem if I had BinHex on the spectre partition, but alas, it is not so. I attempted to port a Stuffed file over, to see if archives would survive the port, but this did not work either, even after I reset the archives creator resource to 'SIT!'. Unstuffit still won't recognize it as a stuffit archive.

Any suggestions? Am I correct in assuming that attempts to modem files from a mac will run into the same binary vs. hex problems? How do I get the durned BinHex appl. over?

thanks in advance...

I would also like to add that MultiGEM doesn't provide any type of
file locking protocols...obviously a problem if you have to C compilers
running and you try and compile the same files...

I haven't had any FAT problems though when I tried this out, you simply
get file handle errors.

Also, ACICS works fine under MULTI GEM too, so you can modem and compile
your C programs at the same time.

Obviously the biggest short comming of this software is resource allocation.

Failure to provide process locks on current utilized resources is something
I think PC architecture has a little ways to go yet before UNIX or whatever
its relative is far into the future is on everyone's desktop.

Try selecting Desk Accessory. It changes the current active background rect,
and also tells the desktop to redraw itself.

>This is just a sample of the many, many times I found that I could not
>use the MultiGem environment. I think the idea and purpose is good...
>god knows it's about time we had a multi-tasking environment for the Atari
>ST, STe, and TT, but only if it works and works well. Personally I found
>too many problems to make it worthwhile.

I use it with Turbo C, it works great for any legal GEM application. It
simply doesn't work well with programs that assume they have the whole
display to use all the time.

Problem is most people don't follow the GEM guidelines for software
construction.

Naughty naughty people. I wrote a GEM application back in 1987, mainly
for printer support functions on the desktop(ie DA). GEM was, still is, so daft
that it was the last GEM application I wrote, and I headed for the TOS
part of the ROMS ever since...

Things I didn't like:

1) Too many bugs in even the basic system libs. Rect control froze for no
appearent reason..(now fixed I HEAR..)

2) File selector...'_' ka boom. (Incredibly innane). (Now fixed...).

In short, even though most problems are fixed with GEM now. It still
has too many short commings. The largest, a considerable learning curve
only suited to hardware that nobody could care less if it disappeared
off the market tomorrow. Not portable, and if you do so you could get sued
if you don't conform to GEM release 3.0 guidelines....(A version so crippled
by Apple's corporate influences that it makes the whole point laughable.)

Too much time to spend on something that won't be around that long.

I have been doing work with X. For all its really bad short commings, you
must admit everyone is using it now. And if your really, really good.

You can write your own contract.

I would like to C PC's evolve to the point with enough cheap power to run
X for the masses. That would be really neato. No matter what PC you own,
you could run X, because thats how X is.

Proper grammar sucks...just say no.

Its much better to adopt the philosophy: "If you can read it and understand it, its proper grammar."

Computers aren't so forgiving..and thats what the use of proper grammar expects you to be and act like....a computer.

Some would go so far as to write a regular expression just so I could make sense of what you were saying.

I would think most of us aren't THAT stupid.

-Greg

PS: As a witness to most of Greg's posting's, I can say so myself that
everything I say, or Greg says, myself included, is quite proper...
give or take a few spelling errors. Which Greg makes, not myself.

-Greg (Myself)

4574. YET ANOTHER 1040--LOADED for sale

4575. Laser 2.0 and TOS1.4

Newsgroup: comp.sys.atari.st
Date: 1992-05-04 00:35:59 UTC
From: bmw@swanee.ee.uwa.oz.au
Message-ID: <bmw.704939759@swanee>
Source record: 222656

Hi,

I have (Megamax) Laser C V2.0 which was working perfectly until I upgraded
to TOS1.4. Now the Laser Shell doesn't operate and tells me it will not work
under TOS1.4 and that I should run patch.prg to enable it for TOS1.4. Patch.prg
doesn't exist. This isn't really a big problem since the compiler and everythingelse still
operate correctly but it would be nice to have the shell operating.
Does anyone have a newer version of Laser C or a fix for the shell? Any help
would be appreciated.

Thanks

Rob

4576. Stand-alone emacs-info viewer?

Newsgroup: comp.sys.atari.st
Date: 1992-05-04 01:02:54 UTC
From: sourada@iastate.edu
Message-ID: <sourada.704941374@pv1784.vincent.iastate.edu>
Source record: 222657

Is there a stand-alone info (the documentation format used by GNU)
viewer for the ST's? Full-blown emacs is just to hard to use with
no hard drive, even with 4MB of ram. And it's overkill for the simple
purpose of reading info, anyway.

Thanks,
Steven Ourada

4578. Public internet access from Chicago

Newsgroup: comp.sys.atari.st
Date: 1992-05-04 03:21:48 UTC
From: ilepore@isis.cs.du.edu
Message-ID: <1992May4.032148.14231@mnemosyne.cs.du.edu>
Source record: 222659

If anybody knows of a public-access internet system with no (or minimal) cost, in the Chicago area, could you please email the phone number(s) and any other pertinant data?

The guy who runs Missionware (producers of Flash II) would like internet access so that he can provide direct online support to internet-using folks, so I told him I'd ask here for info on Chicago-area access.

Thanks!

- Ian

4579. Flash II Press Release

Newsgroup: comp.sys.atari.st
Date: 1992-05-04 03:24:58 UTC
From: ilepore@isis.cs.du.edu
Message-ID: <1992May4.032458.14367@mnemosyne.cs.du.edu>
Source record: 222660

Several folks sent me mail encouraging me to post the offical press release for Flash II when I mentioned it a few days ago. Here it is...

Missionware Software is proud to annouce the introduction Flash II. Details for ordering this new program will be found at the end of this press release, along with some other useful information!

Here's a list of just a few of the new features to be found in Flash II:

* DO scripts are enhanced. Old script files continue to work with new features added for support of Flash II's new features.

* DO scripts are no longer needed, however, for automating your logon process. All board parameters are now set via dialogs. These parameters are saved in the board configuration file and automatically configure Flash II when the board is activated.

* Now permits the use of up to 30 function key macros. 10 macros are considered global, and are accessed by holding down the Control key and F1 thru F10 keys. The other 20 macros can be programmed separately for each board and are accessed with the unshifted and shifted function keys. The macros automatically load when the board is activated.

* Flash II can be used to display, either on- or off-line RLE and GIF pictures. (Particularly handy on CIS which permits the use of online graphics viewing.)

* Includes a new Review Mode. Save your online session to disk and later review it as if you were online!

* Supports the following terminal emulations: TTY, VIDTEX, VT52, ANSI, VT100, VT101, VT102, VT200, VT300 & Prestel.

* Supports ST, IBM and DEC characters sets.

* Flash II is designed to work on any ST or TT, in any resolution, from 80 to 132 columns, and 24, 29 or 48 lines.

* A new type ahead buffer is included. It supports up to three lines of text which is fully editable using the cursor, delete and backspace keys. The [Return] key and [Enter] key perform different functions, depending on the configuration. One can be used to enter forced carriage returns into your message, the other is used to send the message.

* You can configure the amount of memory you wish Flash II to grab at startup. Older versions of Flash grabbed everything available. With multitasking on the horizon, you don't necessarily want to do that. You can continue to <Free> unwanted memory once in the program.

* Includes command support for an automatic answer mode.

* New, full-featured GEM text editor with more flexible block commands (you can now start and end blocks anywhere in a line), cut & paste commands, search & replace function, paragraph reformatting, user tab settings and page widths, automatic word wrap & text wrap modes, and much more.

* The editor now permits you to select the type of display mode desired. Whereas older version of Flash always displayed carriage returns, you can now turn those on or off, as well as all other control characters.

* Almost all menu functions have keyboard equivalents, such as Alt-L to "Load" a file. Where appropriate, these keyboard equivalents match the terminal mode keyboard equivalents.

* Includes Silent Line, a new background file transfer program (replaces "Shadow").

* Internally supports the following protocols: ASCII, Xmodem, Ymodem, Ymodem-G, Zmodem, Modem7, WXModem, CIS B+, Kermit, SEAlink, and Telesoftware (for Discovery/Prestel systems).

* Includes a new "Statistics" feature. Keeps track of all of your online time and upload/download information, and calculates your fees based on the BBS' rates.

* Includes built-in timing functions. Flash II will autostart an online session using this timer.

* Includes a totally rewritten, 226 page manual, fully indexed along with a table on contents. The manual includes a tutorial, detailed section on all functions of the program, and a 50-page section explaining (with examples) the DO script language.

Here's the deal for ordering your copy. We'll accept orders for Flash II using any of the following methods:

1) For outright purchases (meaning you aren't going to upgrade from an older version), the price is $49.95 US plus $4 shipping and handling. You can order via:

a) Telephone: 708-359-9565. If we don't answer, just leave the following information on the machine and we'll process your order: VISA or MasterCard number, Expiration Date, Name, Address, City, State, ZipCode, and phone number. Your charge card will be billed on the day we ship (which may not be on the day the order is

received, but it *will* be within a day or two! :-). If you want us to call you back to confirm the order before it is place, please note that on your message.
b) Mail: Your can, of course, mail order your copy of Flash II. We'll accept VISA or MasterCard, with the information included as noted above, or you can send a check or money order (in US funds please) in with your order. Please do NOT send cash. Although I don't mind receiving cash in the mail, it's really not a safe thing to do.
c) Email: Email orders to J.TRAUTSCHOL will be accepted as if it were a telephone order. Naturally, you must use a charge card for payment. I'll confirm your order also via Email, and will not charge to your card until we actually ship.

2) To upgrade from ANY old version of Flash, you must send us your old Flash disk as proof of ownership. It will be returned to you. Since we need to see proof of ownership for upgrades, you'll have to do the mail order thing here. Upgrades are $30 US plus $4 shipping and handling. You can pay using either check, money order (in US funds) or VISA and MasterCard. When upgrading, you receive *exactly* the same package as those who pay the full amount.

For mail orders, our address is:

Missionware Software
354 N. Winston Drive
Palatine, Illinois 60067-4132 USA

For those of you that sent me your address, you'll be receiving a newsletter soon (I hope) with basically the same information in it as posted above. I'm starting to work on that information sheet now, and once it's done and I get the mailing labels printed, I'll get it sent out...hopefully within a week.

We're working on a demo version which we'll post on the various bulletin boards as soon as we can. The demo will be as functional as we can make it, and will be time limited for your online time, and will probably prevent you from saving some files. Again, as soon as we can get it done, I'll get it posted here for you. I know you're all anxious to play with the program.

One other thing. Since Flash II is a brand new program, newly written from the ground up, we figure you'll find some problems that our beta testers missed. Because of that, we'll be offering a free maintenance upgrade about 3 to 4 months down the road for all current owners. You'll need to ship us your master disk. We'll put the new software on it, and ship it back to you at no cost. If the upgrade can be done by posting a patch program, then we'll do it that way. In any case, we want to make sure that all of your problems, if any, are resolved as quickly as possible so that we can move on to the many enhancements already on the list of "things to do" for future upgrades.

Also, if anyone has a special requirement of some sort, or runs into a problem with, say, a terminal emulation mode, we'll try to get you on as a beta tester for future upgrades. That way we'll be certain to get fixed whatever problem you run into.

Again, thanks for your interest and patience. We'll process your orders as quickly as we can, as well as answer your questions to the best of our ability. We're trying to get the author of the program, Paul Nicholls, on GEnie. However, for those of you on CIS, Paul is there already. We'll be setting up support for the product there as well.

John Trautschold
Missionware Software

| MAJOR DISCLAIMOR:
| I (Ian) do not warrant the accuracy of anything in the press release.
| I'm just passing it along because several folks asked me to post it.

Just goes to show you can't believe everything you read. Flash II works,
despite comments here to the following. I'm using it right now, in fact.

It is better than Flash 1.6, despite the bugs in v2.0. I expect v2.1
to be even better.

This is the official Press Release regarding the merger of Z*Net and
Atari Explorer forming Atari Explorer Online Magazine. The first issue
will debut May 1, 1992.

FOR IMMEDIATE RELEASE-

Contact:

John Jainschigg 718-545-2900 GEnie: EXPLORER CIS:76704,1616
Ron Kovacs 908-968-2024 GEnie: Z-NET CIS:75300,1642
Bob Brodie 408-745-2052 GEnie: BOB-BRODIE CIS:70007,3240

April 24, 1992 - Atari Explorer Announces New Online Magazine!

Sunnyvale, CA.- Atari Corporation and Rovac Industries are proud to
announce a brand new online magazine for the Atari Community: Atari
Explorer Online. Atari Explorer Magazine, the Official Atari Journal,
is now extending its coverage of all things Atari to the online scene,
as well. The first issue of the Explorer Online is set for May 1, 1992,
and the magazine will appear biweekly, thereafter.

"Explorer Online will team up some of the finest journalists in
the Atari Community!" said John Jainschigg, Publisher. "We're excited
to be able to offer such a quality product to our many customers. The
goal of Explorer Online will be to serve the needs of all Atari
users: Portfolio, Lynx, ST/TT, and 8 bit. All of Explorer's regular
contributors will be represented in Explorer Online: from music experts
like Craig Anderton, to Portfolio Wizards like BJ Gleason. And we are
actively soliciting contributions, both to the online magazine, and to
our regular, bimonthly print edition. We want to make Explorer Online
a solid resource for the whole Atari community."

Atari has teamed up with Ron Kovacs, publisher of the Z*Net Newswire
and Z*Net Online Magazines, to produce Atari Explorer Online. "When
we decided that we wanted to do an online magazine, it just didn't
make sense to completely re-invent the wheel," stated Bob Brodie, Atari's
Director of Communications. "In the online Atari community, Z*Net has
set the standard for quality and accurate reporting, and it only made
sense to invite them to participate in this new venture. Ron Kovacs and
John Nagy are among the finest, most dedicated journalists on the Atari
scene today. The entire Z*Net staff will be part of the new team at
Atari Explorer Online. We're very excited that they have chosen to join
us in making Explorer Online the best it can be."

The start of Atari Explorer Online also signals the end of the Z*Net
Online magazine for the Atari ST Community. Current plans call for
Kovacs' firm, Rovac Industries, to continue to publish their popular

Z*Net PC, and Z*Magazine publications. "While there is a certain sense of loss with Z*Net discontinuing, we're very excited that Atari has invited us to be a part of this exciting new venture" said Ron Kovacs, Editor-in-Chief of Atari Explorer Online. "Atari Explorer is one of the finest magazines on the market, and it's very flattering to our efforts that Atari has chosen us to help them with their online magazine."

"When Explorer Publisher John Jainschigg came to me with an idea for a new online magazine, there was no question that we were going to need some outside help. And it was an easy choice to decide where that help should come from. Week in, week out, Z*Net has provided the latest news to the Atari Community for years. Indeed, Z*Net has experienced growth over the years. They have the experience in launching new online publications, like the original ST-Report, ST*ZMagazine, and Z*Net PC. Additionally Z*Net's Atari News Service has appeared in print publications world-wide including: STart Magazine, ST-World Magazine, ST-Informer, ST-Journal, ST-Express, AtariUser, Current Notes, and Germany's PD Journal now Atari Journal. It really just made sense from every side that we considered to ask them to be involved," stated Brodie."

AEO will be distributed worldwide on major information services and networks. Atari Explorer Online will carry up-to-the-minute reports on hot topics in the Atari market: from trade shows to new product announcements. Explorer Online will give you the facts you need to make the most of your Atari investment. Utilities and Atari PD releases, new product demos, product and dealer databases, and other interactive offerings will round out the publication, making Atari Explorer Online the best in online journalism today!!

Source record: 222666

In article <3307@sersun1.essex.ac.uk> woocm@essex.ac.uk (Wood C M) writes:
>
> I have been looking for some time for a file that might
>explain what the difference is between all the files used in tex.
>e.g. what's the correlation/difference between pk libs, metafont
>stuff. What are formats, e.g. latex.fmt/plain.fmt etc.

tex and latex both use the same software but are called with different
format files:--

tex &plain.fmt yourfile.tex == tex
tex &lplain.fmt yourfile.tex == latex <= learn this one first

.tex = Your document
.pk = compressed bitmap description of the fonts (PacKed)
.tfm = description of the size info of a font e.g. what size rectangle a
character will fit into. (Tex Font Metric)
.sty = latex document style file
.mf = metafont desription of a set of characters. You will NOT have to
use these.
.dvi = DeVice Independant file

tex and latex both process the commands to produce your .dvi file, this
file can then be run through any other program to produce either a
screen output or a printer file. e.g. dvi2ps, dvi2tty etc.

Hello.

Well, Atari chose the 030 because they are planning to release the Falcon '040 with a true 040, 16 million colors, separate keyboard, etc..

As for those who don't believe me, I don't ask you to. I had the paper in my hand, I had also a schematic diagram "Confidential". I'm trying to do my best as a member of ST-Magazine redaction team, that is to inform people. Now, trust me or not, that's your problem; but you may be surprised when the machine will be released.

I can't give you the actual name of the person who gave away the sheets, but they come from Atari France.

Such is life.

Vince.

>recognize it as a stuffit archive.
>

You also have to set the TYPE resource string matching the StuffIt archive identifier. So enter your control panel, AccessPC, make an entry ".sit" and click into the MacApp... button. Then choose StuffIt and select the apropriate icon for StuffIt archives, I think it was SIT! for TYPE and CREATOR as well. I can ensure you that it just works fine.
For .hqx encoded files, I set up TEXT/SIT!, and StuffIt will be launched if I double-click any imported .hqx file.

Regards,
Markus.

There are no such thing as X-Windows for the ST, but you can try out UW
on atari.archive
It is a terminal program that uses windows, making it easier for you to
work against a
multitasking machine, since you can have different applications running
in different windows. There are some limitations to the program, but it
is
very good if you intend to do programming across the net, you can have
an Emacs
window and a window for running the program...

(I personally miss a Tek4010 (or 4015 !) emulation, and some of the
possibilities
that still makes Uniterm my first choice.)

>send or receive personal email over internet.
The SC1224 is a color analog monitor. CGA is digital so it would
not work very well. VGA is analog but has a 70Hz vertical sync
while the Atari is 60Hz. If you could change a componet in the
Atari to chage the vert. sync it might work.

4593. WARNING: TOS 2.06 and Warp 9 from Codehead

Newsgroup: comp.sys.atari.st
Date: 1992-05-04 13:24:34 UTC
From: dmk@air31.larc.nasa.gov
Message-ID: <1992May4.132434.12331@news.larc.nasa.gov>
Source record: 222674

Hi netters,
My package from Codehead Tech. came on Friday. In it was both
the TOS 2.06 chips for my 520 STe and the upgrade for QuickST, Warp 9.
First I installed the TOS 2.06 chips by resoldering two jumpers and
plugging the chips into the appropriate sockets. My machine booted up
fine and I started Pagestream. Every time I clicked on a scroll bar,
the image moved twice! I went back to the TEC manual that came with the
chipset and read that this was something that everyone knows about and
included on the disk that came with the chips was a fixit accessory
called button fix. I loaded it up and at first it seemed to do nothing,
but after a little experimenting I found that if I disabled and then
re-enabled the accessory, that the double scroll problem with Pagestream
went away. Oh well, I thought, it's a nuisance but I can live with it
for the new features in TOS 2.06.
The next morning was Saturday and I eagerly plugged in my latest
ST Format disk to look at the Knightmare demo they had included on their
disk. My machine crashed. I tried a demo from a previous disk that I
knew had worked on my machine pre-TOS 2.06, and it too crashed. Concerned
I opened my games closet and pulled out two selections, Prince of Persia
and Stunt Car Racer. Both crashed. For those who are keeping score, this
is now zero for four. Those who read this group regularly may remember
that several months back I asked for help finding a copy of Stunt Car
that would work on my STe. I purchased a new STe compatible copy (there
seemed to be no upgrade path). I pulled TOS 2.06, re-installed TOS 1.62
and everything ran again.
I got off on a bad start with Warp 9 as well. After reading the
installation guide, I put Warp 9 in the AUTO folder right after Pinhead.
Warp 9 would not load. The introduction screen would show up during boot
up, but the Control Panel Accessory said it was not there. It turns out
that the Universal Item Selector III unloads Warp 9. The solution???
Load Pinhead first, then load UIS III, and finally Warp 9.
TOS 2.06 will remain on the shelf next to my soldering iron. The
new features are nice, but I would rather have software that works. I can
live with re-ordering my AUTO folder to get Warp 9 to work, but it
certainly does not _seem_ to be bug-free.

Thanks for reading,
Daniel Koppen

Two small but important corrections: Mark Williams Co never released
->compiler<- source, nor are they likely to, since the ST compiler is a version
of the Coherent compiler, a successful product. On the other hand, Mark
Williams Co. still provides a certain minimal level of support (they helped
me decipher a particularly incomprehensible diagnostic message a few months
ago).

Sorry, Greg. Just for the record, _I_ did not report you to the net admin guys, I was just replying to an email message that I received from someone else. Did not even mean for it to go to the world, just hit the wrong key. Serves me right, eh?

I may not agree with what you say (at least not all the time), but I will defend your right to say it as long as it does not border on slander. We all deserve better than that.

Sorry for the misunderstanding and _do_ carry on. :)

4599. Re: Wanted:GIF and JPEG viewer for the ST.

Newsgroup: comp.sys.atari.st
Date: 1992-05-04 15:57:39 UTC
From: aq115@cleveland.Freenet.Edu
Message-ID: <1992May4.155739.25516@usenet.ins.cwru.edu>
Source record: 222680

There are several good GIF viewers and converters on atari.archive.
One is called DMJ-GIF 3.0, others include GIFVIEW.TTP,though the
latter only shows them converted to 16 colors, whereas DMJ-GIF
converts them to 512 or 4096.

I just got an alpha-test version of a JPEG converter from GEnie,
it should show up on Atari.archive soon.

Daniel:

From what I've read on GEnie, the double-page bug is in Warp 9, and I THINK there's a small fix for it, called Buttonfix. I could be mistaken, and Buttonfix may be for something else.

Also, it's a well-known fact that very little game and demo-type software works on TOS 2.0x. I have a Mega STE with 2.05, and very few of my games run on it that did run on my old Mega ST4 with TOS 1.2.

I too have had problems with Warp 9. Most have been more minor things, but
I would try to run certain programs and it would just bomb in a big way. When
I took out Warp 9, they ran fine.

These weren't any big programs (like say.. PageStream), but its still an
annoyance..

It's an official Atari Corp. publication. The Explorer Online magazine
omitted any mention of permission to post it electronically, so I
checked with John Jainschigg and verified that it was just an oversight.
I'll forward a copy to the moderator of the old ST-Zmag mailing list.
Meanwhile, here is the portion dealing with MultiTOS.

0/ cut here
-0\----------

(Excerpted from ATARI EXPLORER ONLINE, May 1, 1992, Issue #92-01.
The Official Atari Online Journal (c)1992, Atari Corporation)

Rehbock on MultiTOS: The Tech View

One of the highlight's of April's ACE '92 show in Toronto was the
first public demonstration of Atari's new MultiTOS -- a fully-
multitasking version of the ST/TT operating system. According to Director
of Application Software, Bill Rehbock, who demonstrated the system to
excited crowds, MultiTOS "is a high-performance, pre-emptive multitasking
kernel with adaptive process prioritization, in a system optimized to
favor the user-interface, and to comply as transparently as possible with
current applications." In a subsequent conversation, Rehbock elaborated
as follows: "First of all, MultiTOS is definitely not a task-switcher. It
allows multiple applications (referred to as "processes"), both TTP and
GEM, to execute concurrently, each taking a portion of CPU time, as under
Unix. That means you really can be downloading a file, sorting a
database, and typing on a word processor, all at the same time. And the
programs you use don't have to be especially "aware," either of MultiTOS
or of each other, for this to happen.
"Since most programs spend a relatively large portion of their time
awaiting AES event input, MultiTOS is designed to reclaim CPU time that
would otherwise be spent in this fashion. Thus, even without altering
process priorities, MultiTOS manages to increase overall throughput. More
sophisticated forms of adaptation further allow MultiTOS to adjust
process priorities to optimal levels. However, if a user finds that
MultiTOS' own decisions aren't working well for a certain combination of
applications, a utility allows him to graphically review how much CPU
time each process is being offered and how much it is using, and alter
priorities at will." The result is that, from the user's perspective,
MultiTOS seems to perform at a rate similar to single-tasking TOS.

MultiTOS allows as many processes to run concurrently, and as many windows to be open, as memory permits. It can employ the 68030 Memory-Management Unit's (MMU) hardware-based memory-protection capability to prevent accidental memory trespass and restrict how much memory each process occupies. Well-behaved applications can set their own boundaries, using Malloc() and Mshrink() calls; while badly-behaved applications can be restricted deliberately, by the user. Even in the absence of an MMU (i.e., when MultiTOS is running on a 68000-based ST), features have been incorporated to permit indentification and graceful shutdown of rogue processes, avoiding system crashes in all but the most severe cases. File- and record-locking is now automatic at the TOS level -- another reason why current applications don't need to be rewritten to run under MultiTOS. Output from TOS (i.e., non-GEM) applications is piped automatically to the window-manager, and output is displayed in its own window. A variety of Inter-Process Communication (IPC) facilities are supported, including piping and forms of shared memory, as well as a brace of options by which processes may "spawn" child-processes, and control their operation.

Though a portion of MultiTOS will be built into ROM in future Atari computers, the bulk of the operating system is RAM-loaded. According to Jack Tramiel, Chairman of Atari Corp., MultiTOS will be made available in some form for all ST systems (though hardware memory-protection will not be available on systems lacking a 68030 with MMU), and will be incorporated in future Atari products. A pre-release version of the OS has already been sent to developers, along with a reworked Developer's Kit and MiNT-kernel utilities package. Commercial release is expected in Winter. (For further information, developers should contact Bill Rehbock, Director of Application Software, Atari Corp., 1196 Borregas Ave., Sunnyvale, CA 94089, (408) 745-2082).

>Same for "{","}" Characters.
>What is to modify in elvis.rc?
>map #<a>"U \ doesn't work.

For multi-character maps, make sure that you set the keytime variable.
I use "set keytime=8" in my elvis.rc. For older elvises, keytime=2 is
more appropriate.

Also, if you want your map to work in input mode, you should use
map! #<a>"U \
Note the "!" character; this creates a map for input mode.

This is a quite easy thing to fix:

You need :
keyedit.prg, which at least lies in the Uniterm package at
atari.archive,
if it doesn't lie as a standalone, somebody ought to put it as such.

Here you can modify you keyboard layout any way you like it, and then
save
it to disk as a .prg file, which can be executed at boot time.

Good luck.

Jarle.

>onwards.

You either have a problem with the particular disk you are using, or your
copy of things1.msa has been corrupted. The files on atari.archive.umich.edu
DO get un-MSA'd on a double-sided drive properly.

Whether the demo is worth all of the effort is another thing. It consists of
a number of 'Things not to do', generally involving two Karate-style
combatants, miscellaneous weapons of destruction and a lot of blood. No music
that I can remember, limited 'animation', and a non-memorable precis. If you
like sick humor, it might be worth viewing -- once. I didn't finish the demo,
and the disk has been reformatted.

The CodeHeads really are pretty good at getting patches or updates out to correct many incompatabilities. First they need to know what doesn't work, however. How about a list of software titles found to be incompatible with Warp 9 so we can forward it on to them for review? Just make sure your software is incompatible due to Warp 9 and not to a new version of TOS, an ACC or AUTO program.

If you wish, send me your list of "suspect" software via email. I'll compile the list and pass it on to the CodeHeads and upload a copy here as well.

>1.6" More importantly, releasing frequent, free upgrades (freely distributable
>so there are no costs above development costs) makes for happy users==
>increased hardware sales.

There is, however, a dark side to the 'free upgrades' which Apple puts forward for their operating system ... the upgrades to the 'new, improved' commercial software are NOT inexepensive!

Even on the Macintosh there ARE problems with 'won't run on System x.x'. This was -especially- true when System 7 first came out. Of course, you can always upgrade your software library to be System 7 compatible --- most of the time, provided that the company who owns the source hasn't folded, and provide that you send in the sometimes-not-so-cheap upgrade fee).

The advantage Apple's system software has over TOS-in-ROMs is that Apple clamped down early on bad programming practices. If a program broke after a system upgrade, tough. The programmer should have used the 'authorized' programming guidelines in the first place. (Sound familiar to TOS programmers out there???)

I'll be glad to see any enhancement to TOS, including MultiTOS. Just don't expect great things on your circa 1985 520ST. (Even Apple has discontinued 'support' for anything older than a Mac Classic.)

4609. Pc Convertable, Mac Emulator for sale -- cheap!

The rate at which Windows is being taken up by people probably means that
X is finished as a GUI for the masses. Once Bill (spit...) gets Windows
on non-intel platforms we may even see UNIX slide from view. But so long as
there are those who are interested in non-Gates OSes then Atari will probably
keep going for a long time yet. GEM is *far* easier to program that X or
Windows.

I wrote an improved double-scroll fixer acc that doesn't require you to open and close it after entering each application. It's also smaller than BUTTNFIX.ACC. It's available on BIX, GEnie, and Delpi, as SCROLFIX.LZH. I don't know if it ever found its way into the atari archives for ftp'ing or not, I'll try to find out.

I recently ftp-ed GCC-1.40 for the atari ST. I installed it, and
it didn't work.
Let me tell you what I've done:
First I did put gcc.ttp in \usr\gnu\bin.
I placed gcc-* in \usr\gnu\lib, and the include-files went to \usr\include.
Is this the way to install gcc?

Please respond by email.

thanks,

I personally am very happy for you. I've reached the end, too - but probably not the same end you're talking about. The version I downloaded from the Atari archive BOMBS consistently after I finish level 7. Too bad, too - I was definitely planning on registering. Doesn't make sense to register a broken program, though!

I recently downloaded Elvis from Atari archive, 'cause I use VI all the time at work, and didn't want to have to learn a new editor. I got it all unpacked, but elvis.ttp won't start up from the desktop (flashes some message about environment). Well, in checking the documentation, the TERM variable *must* be set, and the docs also mention needing to use the shell program so that TERM *can* be set. But it's not included in the distribution! Where/how can I get it??
If it's not already obvious, I don't have a UNIX look-alike environment on my Atari (yet! I'd like to get one, but would prefer to get freeware or shareware, and don't know of such an animal), so I can't set the TERM variable any other way. Without some sort of shell, Elvis is useless to me, and I'll have to learn Emacs (shudder!) in order to be able to do anything. So where do I get the limited Elvis shell, or a freeware/shareware UNIX type shell? Anyone?

>Windows.
>
>Herb

What are you talking about. X is expaning almost as well as Windows is. Especially
in environments where the use of terminals are great. (IE xterms)
Also, the costs of workstations are coming down, and the main windowing environment
is usually a derivative of X. IE: more and more homes will be having workstations.
Not as many as say PeeCees, but...

Yes, in homes Windows is big. (and slooo) (and sucks in general)
I'll wait for Nextstep....(Then I can sell my DecStation!)

What have you used Xlib(for programming X)? If so you need to wake up. There
are a number of programming toolkits around (Xtcomes with X) and each of which
are very easy to use.

Until I see windows NT. There is no other solution to a networking windowing
environment, and GEM doesn't even come close to the functionality of X.

I have programed in both. (GEM about 6 years ago, I almost went crazy
having to deal w/all the crap needed to get a window up.) As opposed to
a 1 or 2 liner to do the same in X. (Basicly all that is needed to be done is:
Make the appropriate variable declarations...
XtAppinitialize(); XtCreateManagedWidget(Approp args...);XtMainLoop();
Done.

If I had man pages here,I would whip out a quick example.... But this is the jist of it.

Anyway GEM falls into the same catagory as Windows, Mac OS. There are a lot of
operating system specific things involved. X removes that from the
programming environment (as much as possible) and lets the server deal
with all the nasties.

I still have the original MS-DOS version of GEM, which works the same
as the ST version, and uses very little memory or disk space. It's too
bad it never caught on (after Digital Research crippled it to GEM/3).

I suppose it is impossible to recompile GEM desk accessories and programs
for use under GEM on the PC?

4627. Virus question.....

Newsgroup: comp.sys.atari.st
Date: 1992-05-05 03:29:55 UTC
From: oddjob@oz.plymouth.edu
Message-ID: <1992May5.032955.17055@oz.plymouth.edu>
Source record: 222608

I was wondering if anyone knows what the latest version of George Woodside's ST Virus Killer program is ? The version I have says it is

3.84 - dated April 1991.

I just used it to eradicate a nasty infestation of (what it called it anyway) KEY, SIGNUM/BPL or Type 1 virus.

I have NO idea where I picked it up.... except for d/l'ing software from the net I can find only three occassions when my ST(s) have been exposed to outside disks (rather SMALL Atari community around here....) in the past two months.

Case 1 - I checked the sole disk involved and it was clean... ok
Case 2 - This person buys his software or gets PD stuff from me (even more isolated from the Atari mainstream than I am.) and I checked disks he left w/me and they were clean.... another dead end.
Case 3 - The 2 disks I got w/ my new Mega STe.... both infected... coincidence... ?
Case 4 - I d/l'ed one of those .msa type files last week to try on my new STe. I assume that's the only way a boot-sector virus can travel via the internet ?

In Case 3.... what do I do ? ANybody have phone numbers at Atari for somebody who cares about this kind of thing ? These two disks are Atari language disks.... and if a virus got into their master copies at a disk duplicating service.... OUCH!!!!

Which is why I want a newer version of that virus killer. Maybe it's something about the Mega STe and that program.....

Unfortunately I killed every disk I could find that claimed to have a virus (over efficiency & zealous glee I guess.... If I run into another one I'll keep it..... in case anybody needs to see it.

|> on non-intel platforms we may even see UNIX slide from view.

I doubt that window will displace X. They fill different markets. X is a network transparent _windowing system_, not a user interface. The user interface for Windows is Motif-like (if not genuine Motif--I'm not sure), while a goodly proportion of commercial X products use Motif. The Motif window manager is a standard on most non-sun and non-at&t machines (open look, it the standard on these), though it is available on all machines. I am running a motif window manager under X on a sparcstation right now. Unfortunately, most PD X applications (which comprise most of the X software) implement their own user interface, and this interface is usually quite bad.

As for Windows displacing UNIX, I REALLY doubt it. Windows sucks, UNIX is great. UNIX is just an operating system; it is very flexible, and most of the world's most powerful computers run UNIX:

Sun workstations
Digital DECStations
IBM RS/6000s
HP workstations
Cray Y-MP
Connection Machine
Convex
Silicon Graphics IRIS/Indigo
NeXT
etc., etc.

You can do most anything in UNIX, including implementing a standard GUI (take NeXTStep as an example). Windows isn't about to replace UNIX.

The compiled library, g++.olb, is available from atari.archive's gnustuff/tos area. Look for gplibo07.zoo and gpincl07.zoo in the g++ directory. You may also wish to download the latest version (PatchLevel 02) of GCC 2.1.

I just checked the operation of the recently-compiled GCC 2.1. I used make-3.62 as the binary supplied didn't work very well under gulam. I d/led the official FSF s/w from prep.ai.mit.edu, applied the patches as distributed on A.A., and compiled up a new binary. It works fine under gulam.

For sale is a Supra 20Mb hard drive for the Atari ST, price is
180 pounds Sterling.

Features:
20 Mb capacity
Battery Backed Clock for automatically setting system time
Supra Driver and Utilities
Fast Auto Boot
Backup Software
DMA out for chaining other drives etc.
SCSI out for cheaper chaining of other drives etc.

You do not need a shell to set environment variables. There are a couple
of /auto/ folder programs that can do it, and if you plan on doing any
extensive work from the GEM Desktop, you should get one.

If you want a line-oriented shell, there are quite a few available for
anonymous FTP at atari.archive.umich.edu or by mail order from
atari@atari.archive.umich.edu (send a help message for details).

I agree. The price somes too incredible to believe. This is the only
part that I really can't believe.

I've been suggesting with a few others for those things listed for the
past year or more so I'm not really that surprised.

If it is true and it is more than just a "diagram" then I guess Atari will
make a big splash (if they produce enough) in the world.

>and many of their ST games supported MIDI while the Amiga ones did not.

Others will correct me if I'm wrong (no worries, there!) but I believe that
Sierra On-Line announced early this year or late last year that they did not
intend to release any further new titles for the Atari. I hope I'm wrong
because Roberta William's wit and Sierra's interface will be sorely missed.

As an aside, if you like graphic adventures along the lines of Kings Quest,
check out Monkey Island. It's one of the cutest, slickest graphics adventures
I've seen in a looong time.

I wonder what's the size of the UNIX user base? Just consider the rates of
growth of Windows compared to UNIX, let alone the X installed base. In five
years time Windows will dwarf UNIX systems, probably 10 to 1. It's
worse than that though, each UNIX system is binary incompatible, that
means software houses have to charge more to recoup their investments.
If UNIX survives at all, it will be as a niche competitor and no more.

Once NT comes out, I'm sure UNIX systems will begin to be replaced with NT.
It's a sad fact of life - any biologist will tell you that those organisms
that breed more quickly will succeed in the long run, *even* if competing
organisms are more 'sophisticated', 'cleverer' or what have you. The only way
to succeed in such an environment is to compete in niche areas.

It's almost horrific to think that a single company with a single
OS will dominate most of the computer buisness in the years to come.
That's another reason why I'm sticking to something else, in this case
the ST/TT line, I can't afford UNIX (yet).

I know of two icon editors for the TOS 2.0x DESKICON.RSC file.
The first is the Newdesk Icon Editor CPX, which is $20 from
Scott at SDS (let me know if you need his info, I'll get it from
GEnie), or Icon Juggler from Codehead Technology. I don't know if
the Codeheads consider Icon Juggler to be Freeware or what, as it's
included on the TOS 2.06 Utilities disk that comes with their
TEC Board for older ST's, and if you order TOS 2.06 ROMs from them
for your STE.

Why on earth do you insist on buying the Atari badge? I'm sure there are
just as many third-party suppliers in the US and Canada as in the UK
(more, really) whose stuff is just as good.

I just spent three days writing a IIIrd year project report using Write On,
and it was everything I ever wanted.

No dictionary? Maybe you should learn to spell. It was just so easy to draw a
picture in DEGAS, use the supplied acc to grab the image in IMG format, and
insert it straight into the document.

Over about 125 pages, all the auto-reformatting was faultless.

Fast, WYSIWYG, and the print quality was awesome for a 9 pin. The only thing I
would say about Write On is that the printing process is *very* slow. But for
the quality, I thought it was worth it.

I just can't get over that 'No dictionary = useless' crap!
Hey - Dungeon Master hasn't got a dictionary! ;-)

BTW - I have no connection with Write On or Compo.

AND THIS WAS TYPED WITHOUT A DICTIONARY, SO THERE!

I bought ST Review. -blush-.

Anyway - the MIDI supplement was VERY VERY good indeed! Well Done.
The Mag? Hmm.... lose the 'icons' (of which there are zillions (well quite a few anyway)), and employ some proof readers.

Lots of mistakes. I especially liked the question in the questionaire.... this was the FIRST issue right? So why pose the question

"How many ST Review Magazines have you bought in the last
12 months?"

(Probably not exact wording, but similar!)

Did anyone else notice the DIABOLICAL quality of most screenshots?
Too bad for words. A polaroid would have been better.

Maybe they wrote the mag without a dictionary >-)

Message-ID: <1992May5.190917.5934@sun.pcl.ac.uk>
Source record: 222631

Hi there :-)

Synth is coming along, but not as fast as I had hoped. I have got
my final exams for my Honours Degree coming up in a little over 3 weeks so I'm
afraid SYNTH has had to take a lower priority for a while.

I'm really sorry if you were anticipating it 'on time' so to speak,
and all I can do is say sorry ist just not ready yet. I hope you understand,
but SYNTH really has to take less priority than the rest-of-my-life.

Having said that, I have just got a copy of MiNT, and I will CERTAINLY
be adapting SYNTH for use with it. I would actually like to say thanks to Eric
Smith for his attention, he was very helpful.

My final exams are the second week of June(ish). Then I will break free
of this damn academic stuff and code what I *want* to code 24 hours a day. I
will be burning the midnight oil to get SYNTH out.. I am actually suffering
because I am not able to code her right now. (SYNTH is a she, by the way)

Many thanks for your patience. SYNTH *will* appear, and it *will* be
worth the wait if I have anything to do with it!

Thanks again, and stay hopeful....

Edd Deegan
vatec@uk.ac.pcl.sun

PS: Wish me luck in the exams - its the biggies this time!

UNIX is currently at a stage where machines with the same processor family share executables. So, yes, your SunOS4.1.1 binary running on a 68030 _should_ run on Atari's TT UNIX. That was the whole point of UNIX System V--binary compatibility. Of course, a SVR4 68030 binary won't run on a SPARC chip, but then again, neither will a 80486 Windows binary run on any fast (=non Intel) workstation, even if Windows is running.

The point is: different architectures do not share binaries. In the world of sharing binaries across different brands of UNIX boxes with the same processor, though, System V provides portability. Windows can only match, not exceed that ability.

You would have to be insane to replace your UNIX box with a slooow Windows operating system. The only way I can see Windows replacing UNIX is if it is implemented "on top" of UNIX (or contains a UNIX clone OS kernal). Of course, there is already such a thing: X-windows. What _might_ do well is an X-windows version of Windows--now _that_ would sell!

I'm sorry, but I agree with the second comment: (noDictionary != useless).
I have never used a spell checker in my word processing documents--it's
faster to proof it myself.

I use Spectre simply because the word processors themselves are so much
better.

Standardization => Stifled creativity => Productivity

I actually get my work done with Mac WPs. I don't spend my life learning
how the programmer's creative user interface works.

j>... having problems with libraries. I get this strange error about
j>scanning past nulls or some such? Any ideas out there?

I've the same problems with GCC 2.1 Patchlevel 1. I've found out so far that this problem arises only when I've MiNT _not_ installed. _With_ MiNT it works fine. Without MiNT I get errors like the following:

```
GNU CPP-atariST version 2.1 Patchlevel 1
g:\gnu\gcc\gcc-cc1.ttp c:/gemini/tmp//cc100000.i -quiet -dumpbase tr2latex.c
-version -o c:/gemini/tmp//cc100000.s
GNU C version 2.1-atariST Patchlevel 1 (68k, MIT syntax) compiled by GNU C
version 2.1.
In file included from setups.h:17, from tr2latex.c:30:
g:\\gnu\\include\\stdio.h:126: parse error at null character
make: *** [tr2latex.o] Error 1
```

The linenumber given with the error message is not fix but it's changing about 20 lines up or down depending on I_dont_know_what.

Look's very strange, because in the file stdio.h everything is quit all right.

Any suggestions?

nils-henner

should run? Well, if Sun ever did Solaris 2.0, which is the sVr4 version
of SunOs, they might. But Sun stopped supporting SunOs for the 68k family
awhile ago - I didn't even realize they'd made it to 4.1.1 (and if so, it's
certainly the last release). There _is_ some chance that AMIX (Commodore's
sVr4 for Amiga) and ASV (Atari's sVr4 for TT) binaries are compatible, but
I've not heard of anyone actually testing that.

From: ilaskey@cix.compulink.co.uk
Message-ID: <1992May05.215305.450@demon.co.uk>
Source record: 222638

When Hisoft changed to their Gold & Silver schemes for support, it was because they had a choice of upping the price of the software and making everyone pay for support whether they needed it or not, or just making those who needed advanced support, pay for it. Hisoft have a very good reputation for support & help in the UK and most people here seemed very happy to pay for continued support. Gold support is an annual fee that ensures free updates of all software as and when it is released including minor upgrades, silver is access to closed conferences on CIX and other such systems that Hisoft use to support their users.

I would consider 20 pounds very cheap for lifelong support for all the Hisoft stuff I have. You can pay a lot more in PC land. We were lucky to get it free up until now.

As far as the point about the delay in the Symbolic Debugger, Hisoft have known about MTOS for some time and were waiting for the internals to settle down so as to ensure that it was compatible. Both the latest version of Lattice C (5.5) and the debugger are fully MTOS complient, in fact the new integrated environment/debugger actively uses it when available.

Yes, but X11 is a _huge_ application. It's big, it's slow and it's inefficient. Microsoft fully intends to push Windows NT (which is a full operating system) on any platform that looks like being successful.

>As for Windows displacing UNIX, I REALLY doubt it. Windows sucks, UNIX is

>NeXT

Yes, but these battles are rarely won on technical merit. MS-DOS is, ah, less than wonderful, but look how popular it is. Yes, UNIX is better than most other operating systems, but it's also too big, too slow and too inefficient. Just think of how much more potential all those machines would have if they had an _efficient_ OS.

>You can do most anything in UNIX, including implementing a standard GUI (take
>NeXTStep as an example). Windows isn't about to replace UNIX.
>

It had 256 bytes of RAM attached to the CPU and an 8K Graphics Programming
Language (GPL) interpreter in ROM also attached to the CPU. There was a
2nd processor (for graphics) attached to the CPU via some read/write registers
- it had 16K of RAM (wow !) and the basic programs went in there.
>
> You had to buy a ridiculously expensive disk system before you could do any

Yes, the Basic interpreter was written in GPL and so Basic was double
interpreted; which combined with the 2 byte read/write limit to the RAM where
the basic was slowed it down even more ! Talk about shooting a 16bit
CPU design in the foot ...

4658. TOS 2.05 HELP!

Newsgroup: comp.sys.atari.st
Date: 1992-05-06 02:38:21 UTC
From: as423@cleveland.Freenet.Edu
Message-ID: <1992May6.023821.13557@usenet.ins.cwru.edu>
Source record: 222644

A friend of mine who is disabled just bought a MegaSte, he called me today and was shocked if not angry that he cannot use alot of his stuff on it. The main program he cannot run is Falcon, I have an STe with TOS 1.9 and I do not have the same trouble. Although I do have some problems with older stuff, most of my collection still worked. I need to help him rectify the situation or the Mega goes back. His whole life is games and DTP as he cannot do too much on his own. I guess I am asking if anyone knows of a way to fix this? Can he downgrade the TOS, or is it hardware? I really cannot believe the stupidity of Atari, I purchased an STe during Christmas and feel I have been burned!

I don't think UNIX is slow. Software, is slow relative to the age of the computing hardware it is running on.

Workstation technology has quite a ways to go yet before it max's out itself. During that time you can expect UNIX performance along with X to increase in performance anywhere from 10-100 times during the next 5-8 years.

Windows hasn't even established itself as a protected mode environment yet, and there are still real problems with 8086 architecture and UNIX implementations to slow Windows technology enough to prevent your rapid multiplication of Windows platforms to the point of replacing X/UNIX.

Trust me, UNIX is fast on 68060's 586's and MIPS R4000 machines...

New networking technologies are also overcomming and dwarfing X's relatively immense hunger for network bandwidth. Improving X's performance by order of magnitudes with each new advance in network products.

>

There are also better alternatives to the Windows software technology. HP for example does a wonderful job with their version of HP windows for most of their 425t machines. Far better than Windows in my opinion and much more powerful.

Unix is also moving more and more to turnkey on the fly fault tolerant software systems. Windows is light years from reaching this point, adding headaches to any process that goes wild or nuts.

OK. I downloaded compress.zoo from atari.archive.umich.edu. I read the Docs for the TOS version (very brief docs I must say). Anyway, Docs say to type

uncompress foo.z

and it works!! ALAS, all I got was a file not found error. My situation is thus:

- 1040STe with one meg, no hard drive, two double sided drives
- No Minix, MiNt, Etc
- Need to uncompress from one external drive to the other

I am trying to uncompress UNITERM.tar.Z. the scary part is, when I get done (God willing) with the uncompress, I need to face the .tar decompress.

If someone could E-Mail or Post (as I have noticed other users with similiar problems) a step by step solution to this problem, myself and many others would be eternally grateful.

Roger McGhee
(auotman@milton.u.washington.edu)

P.S. I apologize for posting this twice, I realized later that my first appeal for help may not have included enough info for a useful response. Sorry to waste bandwidth.

4666. Problem with Setscreen / Mega STE

Newsgroup: comp.sys.atari.st
Date: 1992-05-06 08:03:52 UTC
From: CASTAN@bonnie.physik.uni-stuttgart.de
Message-ID: <1992May6.080352.1598@news.uni-stuttgart.de>
Source record: 222552

Hello there,

I have found a common Problem with Mega STEs with TOS 2.05 and resulotion
ST high.

If you call XBIOS.SetScreen with parameters you have read from XBIOS
before, then parts of the right screen skip to the left overscan area.
This occurs with Monitors SM 124, SM 144 and SM 146.
I have reproduced this with Omikron-Basic.

You can reproduce the effect with the following program:

```
MODULE SetEd; (* MEGAMAX MODULA 2 *)

FROM SYSTEM IMPORT
ADDRESS;
FROM GrafBase IMPORT
GetScreen,SetScreen;
FROM Terminal IMPORT
Read,WriteString,WriteLn,WritePg;

VAR
log,phys: ADDRESS;
rez,I: INTEGER;
CH: CHAR;

BEGIN
WritePg();
REPEAT
(* Hole aktuelle Bildschirmparameter: *)
GetScreen (log,phys,rez);

(* Zur Orientierung auf dem Bildschirm: fuelle oberste Zeile mit Ziffern *)
FOR I := 0 TO 7 DO
WriteString ('0123456789');
END;
WriteLn;
Read (CH); (* Abbruch mit Spacebar *)

(* Evtl. gelesene Werte wieder setzen: *)
IF CH#' ' THEN SetScreen (log,phys,rez) END;
UNTIL CH=' '
END SetEd.
```

Could anybody out there try if this occurs with
- 1040 STE
- TT

- MegaSTEs with other TOS-versions
and send me the results?

I'll summarize.

****
So programs should avoid calling SetScreen if they are allready in
*ST high mode (rez=2). *
****

Gerd

> Here is my code to access SCSI Tape Streamers on the Atari ST and TT.

I think is very bad style - to say the least. More than 90% of
the code are taken from the SCSI tape driver by Paul Moreau
(version 11/5/90) without modification. The one and only part
where his name is mentioned is a comment in test/tapetest.c. I
think it is a bad habit to put your copyright on somebody elses
code. At least say that you used it!

And this is not only bad style, but also bad code:

Many commands (including so important ones as REQUEST SENSE) do
not work. They did not work with the driver by Paul Moreau, too -
and this is exactly the same source. The reason is simply: These
commands try to transfer data that is not a multiple of 16 bytes
so the contents of the DMA FIFO will not be transmitted.

As in the old code by Paul Moreau: error handling is very poor.
For instance all dump or restore operations will be aborted for
every recoverable error. I do not like my restore to fail when
the tape drive was able to recover from an error!

Well, I guess I posted all I knew about it. I know it will be supporting both normal TV and VGA monitors, and it should be released in a sorta 1040 box.

Grapevine says that it was first presented at CeBit in a black box with separate keyboard, but it seems it was just a prototype.

Anyhow, we believe they delay the release until great softwares will be available ; this might include games, built-in modems, or graphics.

Enjoy.

Vince.

How to get hdx-5.zoo from the archive at
Dept. of Computer Science, Utrecht University:

NOTE: In the following I have assumed your mail address is john@highbrow.edu.

Of course you must substitute your own address for this. This should be
a valid internet or uucp address. For bitnet users name@host.BITNET
usually works.

by FTP: (please restrict access to weekends or evening/night (i.e. between
about 20.00 and 0900 UTC).

ftp archive.cs.ruu.nl [131.211.80.5]
user name: anonymous or ftp
password: your own email address (e.g. john@highbrow.edu)
Don't forget to set binary mode if the file is a tar/arc/zoo archive,
compressed or in any other way contains binary data.
get ATARI-ST/utils/hdx-5.zoo

by mail-server:

send the following message to
mail-server@cs.ruu.nl (or uunet!mcsun!hp4nl!ruuinf!mail-server):

begin
path john@highbrow.edu (PLEASE SUBSTITUTE *YOUR* ADDRESS)
send ATARI-ST/utils/hdx-5.zoo
end

NOTE: *** PLEASE USE VALID INTERNET ADDRESSES IF POSSIBLE. DO NOT USE
ADDRESSES WITH ! and @ MIXED !!!! BITNETTERS USE USER@HOST.BITNET ***

The path command can be deleted if we receive a valid from address in your
message. If this is the first time you use our mail server, we suggest you
first issue the request:
send HELP

Having used MultiGEM 1.0 for about three month I think it's quite an usable program, but you have to customize your working environment to take the most out of it.
First of all you need to stop using NeoDesk 3 and adopt Gemini instead.
Apparenly MultiGEM, being developed in Germany, works better with teutonic software.
At the beginning I didn't like the idea of changing my usual environment, but now I find it was worth it: not only I have all the advantages of a multitasking environment but I discovered that Gemini (even if it shareware) is better than Neodesk to work with. It's a solid desktop substitute that adds features that should be standard in any Atari program like : standard GEM clipboard (not the RAM based one that you find in NeoDesk), recoverable Trashcan (much more reliable than the one in NeoDesk), built- in unix-like command shell, use of standard GDOS fonts in every text window.

As for the G+Plus problem I suggest you to use the german AMCGDOS (shareware) that never gave
a problem to me, and for communication use Rufus (shareware again).

statistically 80% of the software works correctly once configured in the right way. I presume that MultiGEM II (announced at the CEBIT) will be even better.

If anybody need some more information, just send me a message.

Fabrizio Lugli

>programs cause problems?
>
>Kev

Can't vouch for ALL other packers - but ALL the others I've used are
OK with MINT_v0.94. These are the original PACKER, PACK-ICE (v_1.5 and v_2.4),
and also PFXPAK.

By the way when I posted the original letter about this
incompatibility of the POMPEY packer, I said the POMPEY Packer, though slow,
had the best compression of the lot. Since then I've aquired PACK-ICE (or ICE)
v_2.4 - which appears to be a HUGE improvement over the earlier version. Not
only does it pack about as fast as PFXPAK (you can pack a 600k program in a
about 5 minutes), its compression is also better and indeed seems better even
than the POMPEY Packer (admittedly I have not got the VERY LATEST version of
this). Programs packed with ICE_v2.4 do, however, take marginally longer to
unpack when loading than those packed with PFXPAK (a program of unpacked size
600k seems to need about 10 seconds to unpack with ICE).

Oh, and just one other thing I've noticed about programs packed with
PACK-ICE (both versions I have) is that SOMETIMES they appear to become
"undeleteable" i.e. if you overwrite them you end up with 2 files of the
same name on the disk. This phenomenon I've witnessed most often when such
packed programs reside on RDY/RDE ramdisks. Such "undeleteable" files can be
deleted using a disk tool like DLII.PRG - and I've often had to resort to
this to get my ramdisk "back to normal". I have no clue what is going on
here - it happens fairly infrequently and ONLY with programs packed with
PACK-ICE (Yes, I did choose the "relocateable" option when I did the packing).

Anyone out there with any ideas on this? W. Alan B. Evans

bbs.fox@goonsquad.Spies.COM writes:

> Can you give any more details as to what else will be available
> in the Falcon's lkittle box of tricks?

As a (small) anti-dote to all the rumours about the Falcon:

A representative of Atari Benelux has stated repeatedly
(on their own buletin board system) that the Falcon as shown
on CeBIT was *not* a product announcement or preview or whatever.

According to him, (I quote and translate from memory)
"The Falcon was just a demonstration of the new Atari chip set
for a planned series of computers from game computers to work stations".

For me, this raises two questions:
1. Why wasn't that explained on CeBIT (no report I have seen mentioned it)?
2. What about the equally confident statements from other sources
that the Falcon *is* a real product?

I thought I'd seen the english crackart docs mentioned in one of the
New? files at atari.archive, but they don't seem to be there. I've
searched archie with no luck, so is there anyone out there willing to
email them to me, or upload them?

Many thanks,
Adam.

dhbutler@magnus.acs.ohio-state.edu (David Butler) writes:
>Sorry, I agree with the original comment, no matter how good the program:
>
>NO DICTIONARY = USELESS!!!

One might as well go the whole route and say

NO AUTOMATED GRAMMAR CHECKING = USELESS!!!

In all the time I've used dictionaries with word processing programs, I have come across an average of about .1 word mispelled. However, during that same period, I have come across dangling participles, badly phrased passages and, most importantly, properly spelled words which are inappropriate for the given context. The latter are usually homonyms.

I haven't come across any microcomputer based word processing program capable of eliminating all grammar and spelling errors, and, in general, I do not produce spelling errors. Ergo, the lack of a dictionary in a word processing program makes that program useless only for those who do not know how to spell, while the lack of a grammar checker makes that program useless for those who write.

4681. High Density Disk Drives

Newsgroup: comp.sys.atari.st
Date: 1992-05-06 14:03:24 UTC
From: scst21@csc.liv.ac.uk
Message-ID: <1992May6.140325.1478@and.csc.liv.ac.uk>
Source record: 222567

Has anyone been able to connect a high density disk drive to an Atari Mega STE? I have heard that for a HD drive to function correctly, the floppy disk controller chip must be able to work at 16Mhz. I have been told that the chip in the Maga STE can work at this frequency. If this is so, how do I connect a HD drive to the computer. Will it be possible to have the internal DD drive connected at the same time as the external HD drive? Also, can the HD drive read normal 720K formatted disks?
If anyone has any information concerning the above, I would be very interested to see it, as I am currently useing a very large number of DD flopyy disks, when I attempt to back-up my 105 megabtye hard disk drive!!.

Thanks for your help,
Jon.

Source record: 222569

My $0.0230 (0.0014 PST, 0.0016 GST).

1) Windows is crippled now by the fact that MS-DOS is not a naturally multi-tasking OS. It seems the best way to build a windowing system is to start with a multi-tasking OS and build over it, rather than trying to kludge multi-tasking (or application switching, which is more accurate with Windows and Apple System 6.x) in any windowing extension.

2) NT might solve this kludge (I would assume that it would be pre-emptive multitasking with light-weight threads, message queues, semaphores and a whole list of things MS-DOS needs), but Unix users are very loyal. As the workstation market expands (with falling prices), Unix will become more entrenched, despite "better" operating systems (look at how long poor old MS-DOS held on!). Windows could benefit to a large degree by having a better OS underneath it, so that little things like event handling were improved (but MS-DOS is MS's baby, so they really have noone but themselves to blame).

3) NT is a wholly proprietary operating system. Companies are moving (in a real sense) to open systems and non-proprietary solutions in all areas of their computing environment. I doubt that if the IBM market wasn't saturated with cost-competetive clones that it would have the share it does. For the same reasom that VAX and the VMS OS were dumped, people will avoid NT, unless it is licensed in the same fashion as Unix. Many are tossing MS-DOS for IBM flavours of Unix (SCO, QNX, etc) already.

4) Unix already has versions for most major platforms. This will be a big catch-up job for NT, and MS, who as far as I'm aware do not have major products in the workstation market already. Unix also has a large base of utilities that would take years to re-create. MS is a shrink-wrap company catering to the micro market, and while having some OS and programming product, their strength is in their applications. Translating this to success in NT against the current momentum of Unix is hardly guaranteed, and not a trivial task even for a large compnay like MS.

5) Unix is weak in the area of user applications. There are many programmers' utilities and the like, because of the environment it evolved from, but few low-end user applications (the first real ones are just starting to pop up). Unless companies start getting into this market, this will continue to be a major weakness for Unix.

6) Without X-Windows and MOTIF or Open Look, I'd say Unix would be doomed. Microsoft is competing in an existing market -- it did not invent the GUI, but is merely exploiting the technology. This is a weakness of Microsoft -- it is rarely innovative in its technologies or its approaches. What it does well is develop in existing technologies and market them; but

it will need to change its marketing to get dominant share of markets and displace Unix, and that assumes the product is strong enough to support any marketing strategy.

7) With RISC architectures and cheap RAM, speed and size are becoming less important. This was always a weakness with Unix, but is of little importance now and will be no consideration at all within the next couple of years. On the other hand, the IBM architectures are just getting into expanded memory architectures, and the like. As far as chasing hardware evolution, Unix has an edge.

The basic point is this -- Microsoft has had outstanding success in the micro market selling to users who are relatively unsophisticated. The applications they market are very well suited to this segment of the market (which is large). But the domination of NT/Windows is in large doubt -- systems software has always been a Microsoft weakness, and MIS people coming out of proprietary systems will be naturally wary about installing one company's (read "a proprietary) OS on machines enterprise wide. They don't need another single-vendor solution dominating their environment.

Unix, on the other hand is a very strong operating system. It has its faults, but all OSs do; but it is a mature and stable piece of software. It is available on many platforms, and has a myriad of utility-style software available for it. But it has few applications of MS calibre, that are of value to low-end users.

I know that some people want to buy in to a corporate sponsored ideology, but I think the important thing is to identify the factors that will sway this competition, and decide who gets better market placement. Will workstations take over the micro market? Will application developers get on board Unix as the market expands? Will NT be viable (and it has a hell of a lot of history to overcome wrt MS-DOS)? Will MIS accept NT broadly (beyond the IBM micro environment)?

My personal *GUESS* is that Unix will not be displaced by anything except a radically new OS that blows it out of the water, and is available across platforms. I doubt NT will be such a product, given Microsoft's traditional strengths and weaknesses. Microsoft will still have a healthy share of the market, composed mostly of micro share, but to assume that they can waltz into Unix territory with little appreciation of differences in technology and users and take over belies little understanding of the momentum Unix has.

Brad

Cross-posted to: ont.micro,kw.micro,comp.sys.atari.8bit,comp.sys.atari.st,uw.sys.atari

In May, the Kitchener-Waterloo Eight Sixteen Thirty-two (KWEST)
Atari user group will have a general meeting with the spotlight on
Desktop Animation.

Our 16-bit library currently has over 400 disks of public domain
and shareware software.
In addition, there will be our updated catalog disk and our
disk-of-the-month.
Our 8-bit library is also available at this meeting.

As well as our own newsletter "The Hard Copy", we will also give
attendees the May issue of AtariUser.

The group welcomes new members and visitors with
8-bits, 16-bits, or those just curious.

Meetings held at the University of Waterloo in the
Math & Computer Building.

Room opens at 7:00 pm. Meeting starts at 7:30 pm.

Wednesday, May 13, 1992
DCS Course Room, Room 2009 (2nd floor)

Call 579-3695 for more information.

Hope to see you there,
Dani Roloson

4688. TOS 2.06 Compatibility

Newsgroup: comp.sys.atari.st
Date: 1992-05-06 15:49:41 UTC
From: malay@sae.com
Message-ID: <1992May6.154941.19394@sae.com>
Source record: 222574

I have TOS2.06 installed and here's a list of commercial game software that I own that works:

The Killing Game Show - Psygnosis
Robocop 2 - Ocean
Viz - Virgin Games
Zany Golf - EGA
Artura - Arcadia
Continental Circus - 16 Blitz Plus
R-Type - The Hit Squad
Chuck Rock - Core Design
Blood Money - Psygnosis
Toobin' - Domark
The Killing Cloud - Image Works
Lemmings/More Lemmings - Psygnosis
Mega-Lo-Mania - Image Works
Xenomorph - Pandora
Techno-Cop - US Gold
Zak McKraken - Lucasfilm Games
Elvira - Accolade
Monkey Island - Lucasfilm Games
Leisure Suit Larry I,II, & III - Sierra
Wonderland - Virgin Mastertronic
Utopia - Gremlin
Dragon's Lair - Readysoft
Wrath Of The Demon - Readysoft
Robocop 3 - Ocean

and here's what I couldn't get working :

Fiendish Freddy's Big Top O' Fun - Mindscape
Barbarian - Psygnosis
Defender II - ARC Software

My game selection is varied in terms of program age, vendor, and protection scheme and the percentage of compatibilty is very high. I am disappointed that Defender II doesn't load - I believe it is the protection scheme and I intend to drop a letter to the company telling them so.

Bob Malay

>
> -Dave

This question has come up twice in a matter of hours (here and c.s.a.s.t),
so I suppose a public reply is in order.

Any time you get a file from atari.archive.umich.edu, make certain that
you tell the FTP program to set type BINARY or IMAGE. The default FTP
behavior is to mangle the file in an attempt to be helpful (it's altering
newline characters in a file that isn't ASCII).

Be warned -- FTP is not the only program that will do this; Unix Zmodem
also has to be forced into binary mode or it does the same thing.

Once the file is properly fetched to your local mainframe, you can use
whatever file-transfer software is available locally. Ask your system
administrator or other users for help. The unix sx utility will work,
although it is slow and not particularly robust. Zmodem (sz) usually is
preferable.

If you're getting ``checksum error'' messages from your terminal program,
it's likely that you have either a poor phone connection (line noise) or
your mainframe has a problem with its modem flow control. The latter
possibility is relatively unlikely if you're running Xmodem (128-byte
packets), but it occasionally crops up with protocols that use bigger
blocks.

If your friendly neighborhood mainframe simply can't run an error-checking
file-transfer protocol worth a hoot, you might try converting the file to
plain text using uuencode. You then could cat the uuencoded file and
capture the result with your terminal program. The ST programs UUD.TTP or
UUCODER.PRG can then convert the encoded text back into a binary file.
There is no error-checking with this option, however, and it won't work
over a noisy phone line.

Once you get the binary file into your ST, you may need to uncompress,
unarchive, or whatever. Here are a few common extensions and explanations

of their use.

.ARC Archive, extract with ARC.TTP using the X flag
(arc x filename.arc).

.LZH Archive, extract with LHARC.TTP, LZHnnnn.TTP, etc.
Be warned that some versions of LHARC are broken.
Usage is similar to ARC.

.ZOO Archive, extract with ZOO.TTP using the x flag
(or ZOO -restore filename.zoo).

.Z Unix-style compression. Uncompress with COMPRESS.TTP
using -d flag to signal decompression.

.tar Un*x tape archive, extract with TAR.TTP. Note
that .tar.Z suffixes are common on Unix systems;
the filename may be truncated when you transfer it.
Watch out! You need to uncompress, then untar.

Kenneth:

You and your friend have not been burned by Atari. You have been burned by software developers that don't play by the rules when they write software. That's why Falcon doesn't run on a Mega STE. In fact, from what I've heard, it's not supposed to run on TOS 1.6 on a normal STE. Blame the folks at Spectrum Holobyte for refusing to update the software for compatibility with the new machines. They say that the market is too small to warrant it. So as far as I'm concerned, TO HELL WITH THEM. It's the LAST product I ever buy from them. Falcon is a great game, but if they can't lift a finger to produce a simple update, then they're not worth the trouble to deal with.

The same thing goes with all of your old stuff. Much of it was written when TOS 1.2 was the newest thing out, and developers took shortcuts to make stuff work, rather than taking the time to do it right. Now those of them that are still around are either updating their software, or claiming that the Atari market is too small, and only producing PC or Amiga software.

If your friend wants to run his old stuff, his best choice is to pick up a used 520ST or 1040ST and run games on it, and his DTP stuff on his Mega STE. That's what I did.

Sorry I can't be more helpful.

> is it hardware? I really cannot believe the stupidity of Atari, I
> purchased an STe during Christmas and feel I have been burned!

This has nothing to do with the stupidity of Atari. If the authors of
Falcon have written a program that won't run on the Mega STE, I'm not
surprised -- they did the same thing with the original Mac version that
wouldn't run on a Mac II.

To wring the most performance out of the computer, game software tends to
bypass the operating system and work directly with hardware. When the
hardware is redesigned, the game software breaks. This doesn't mean that
the hardware designer did anything wrong. If the hardware folks were not
allowed to change anything, computers would not improve. Usually the game
publisher figures out the problem and issues a new release of the game
that checks the hardware configuration and makes adjustments if necessary.

Application software (DTP, word processors, spreadsheets, etc.) should not
break when the hardware is upgraded, since they rely on the operating
system to handle hardware details.

Complain to the software publisher. If they can't help you, and if Falcon
is more important than the Mega STE hardware features, take the hardware
back.

>
> and it works!! ALAS, all I got was a file not found error.

It's probably looking for a file named UNCOMPRESS, which is not what
you want. The docs are not particularly clear.

The trick with COMPRESS.TTP is that it looks at its own filename to
determine its identity, and then modifies its behavior accordingly.

If it discovers that it has been renamed to UNCOMPRESS, it defaults
to decompression. If it has been renamed to ZCAT, it decompresses and
writes the output to the console.

But a program can't reliably determine its own name on the ST. There
are several incompatible ``standards'' for passing this information
to child processes, including one currently endorsed by Atari, but
Atari does not support its own method in the Desktop software.

Fortunately, COMPRESS also obeys several flags that can be passed as
arguments. The -d flag tells it to decompress. Therefore you should
double-click COMPRESS.TTP, and when the TOS-Takes-Parameters dialog
box comes up, type "-d B:\FOO.Z" (or something similar).

> I am trying to uncompress UNITERM.tar.Z. the scary part is, when I get done
> (God willing) with the uncompress, I need to face the .tar decompress.

Start out by naming it UNITERM.TAZ, then uncompress it as above. You
should then have UNITERM.TA, which can be renamed to UNITERM.TAR and
fed to a .TAR unpacker.

It's probably a whole lot simpler to do all of this on your Unix
system, then ZOO up the results and transfer them to your ST. My
personal opinion is that the ``tar and compress'' method applied to
ST files should lead to ``tar and feather.'' It's a whole lot of
nonsense that could be avoided by using a competent archiving program.

No, Sierra is definetely not any more converting games for the ST, as
he is not very popular in the US (as you surely know), and his hardware
(too few colors, itchy sound) isnt very practical for games.
...but there is a Falcon/030 to come...

>

I don't see why they would build a computer with this much power and
put it in a 1040 style case. First of all, it makes the thing difficult
to expand. Second, it helps to make the thing not "look" like a real
computer, further propogating Atari's current struggle to break out of
it's video game maker image. And thirdly, I believe that many people
like and would want a sepparate keyboard. Sure, maybe the all-in-one-case
design might be a little cheaper, but a real case with detatched
keyboard would be nice and should at least be an option. The 1040 box
just seems to scream "I am a home computer for playing video games. Don't
put me in your office!"

Asking $100. Here's what the box says:
System Requirements:
Mac Plus, SE or II family with at least 1Mb of memory, 2Mb
recommended; 2Mb required to run under Multifinder.
1 800Kb disk and 1 hard disk
Fully compatible with all Apple Macintosh printers and all
PostScript-compatible output devices.
Import/Export capabilities
Mac formats: MSWord 3.0 and 4.0; MacWrite 4.5 and 5.0;
WordPerfect Mac 1.0.
PC-DOS formats: Multimate version 3.3; MultiMate Advantage
version 3.6; Multimate Advantage II; and Multimate version
4.0; WordPerfect 4.1, 4.2, 5.0, and 5.1;
DisplayWrite/DCA/RFT.

This is a new package, but it has been opened. It has not
been registered, and all materials (docs, boxes, registration
materials) are included. The "S" stands for sound, i.e. you
can include sound notes in your documents (if you have the
appropriate hardware).

No dictionary? What's wrong with a stand-alone spell checker. Once there was
such a beast, called "Thunder". It could be used as an acc or as a prg.
And what about the PD "Spell"? Is it available on the ST - I'm not sure.

Cross-posted to: rec.music.synth,comp.music,comp.sys.atari.st

Greetings, all.

I have a Roland S-10 and an Atari ST (no flames, please!).
I'd love to write a full-blown editor-librarian for this setup, as it seems that none has ever existed - and I've seen at least three or four postings on r.m.s asking for such a program. However, I'm still rather befuddled by the S-10's MIDI implementation chart, and by the cryptic, esoteric error messages returned by my Laser C compiler (I'm spoiled, I have Turbo Pascal on my PC at work). Meanwhile, I have all these samples on quick disks, which I'm becoming increasingly paranoid about losing.

I seem to remember that a company (Dr. T?) came out with a program that would send and receive generic system-exclusive dumps on the ST. This would seem like a resonable interim solution, while I learn more about my programming environment and the Roland sysex format. Does anyone have any information about this program (i.e., will it perform my job? How much does it cost? etc...)

Thanks in advance.

Ive got an ICD AdSCSIPlus ST host adapter, and just a short while ago, I got a sense code $10. Looking it up in the manual, it tells me that its either an ID or CRC error. Now, in the directory I was working in, Gulams ls -la lists three non-existant files. I cant show you the output, because there are control characters in the file name. I tried to rm *, but it comes back with an exit 33. I dont have the Gulam docs, what is code 33?

But my big question is, how can I get rid of these bogus files? And _please_ dont tell me to reformat the drive! I dont wanna do that, until a last resort...

Oh, also, the first part of the attributes are h, whereas most of the other files attributes begin with an m.

Thanx

Atari 520ST + HD for sale: $450 + shipping

520ST (+ memory upgrade to 1 megabyte, TOS 1.0 ROMS)
atari mono monitor
BSD 65 megabyte harddrive (Seagate 277R), w/clock
1 SS floppy (*)
Classic 1985 Atari Development Docs, GEMDOS Doc, PRO*GEM, etc.
Abacus book on GEM programming
Empire: Wargame of the Century
... and random stuff.

I bought this machine in 1986 and it's spent 2/3 of its life in my closet; too many Suns at work to enjoy playing around with my toy. The memory upgrade can go to 2.5 megs by just plugging in chips (but it's one of the older cards, so these are not simms, these are honest-to-god chips); you can go to 4mb with a small motherboard modification.

(*) The only problem with the system is that my floppy power connector is kaput. The drive itself seems to work fine.

First come first serve; send email or leave a message for me at home (804) 971-5887 or work 924-4914.

4708. Portfolio

Newsgroup: comp.sys.atari.st
Date: 1992-05-06 23:50:44 UTC
From: onstott@a.cs.okstate.edu
Message-ID: <1992May6.235044.17163@a.cs.okstate.edu>
Source record: 222596

I have a question for those who might own or have used a Portfolio.

I will be commencing graduate study at the University of Chicago next fall and I thought I might buy a 386 notebook to carry around the University. Alas, they are out of my price range and I already have a lot of $ invested in my Atari rig which I mainly use for hacking and MIDI. I do, however, have a copy of Word Perfect ST that I use for papers and it works relentlessly. Thus, I can see no reason to pay $1500 for a 386 laptop.

My question is: If I decided to purchase the Portfolio for use in the library mainly (collecting Bibio info, abstracts of books, notes, etc) how easy is it to hook up the ST and d/l the information?

I noticed that there is a serial expansion kit available so I suppose all I would need is a null modem. Do I need the serial expansion kit?

How easy are they to type on, and how long do they last, is the screen readable, etc, etc, etc..

Just a general eval would be nice. By the way, what type of text processing is available for it? HOw easy is it to use the built in text editor?

Thanks.

BCnya,
Charles O. Onstott, III

Do you think that this is all it will handle (ie DRAM support on
board and just plug SIMMs and go) or whether this is just the models that
Atari will come out with and that normal TT memory modules will still work
(ie that 32MB board from Germany will still work).

> ROM : 512 Kb, plus 128 Ko in the cartridge port.

This is nice, but will it allow bus mastership? That would be a real
plus to be able to just buy an upgrade board when the 68060 comes out and you
want to use it instead of the old '030 (or '040 if they come with that...:).

<video stuff deleted>

Hmm, sounds a little inefficient to put an IDE drive in a machine with
an on-board SCSI-2 chip, and IDE drives are not that much cheaper than SCSI,
especially not enough to justify a whole IDE chipset + integration into the board.

> Lastly, retail price under $700
>
All I can say about that is...I doubt it. Make this machine CHEAPER than a
TT/030? Right....

One other thing to try, if you havn't already, is to turn off your monitor while you sample. I find that the whine from the monitor will make it's way into the sample. Or is you can move the monitor far enough away that it doesn't affect the sound.

As Dave mentioned, the phones jack is probably best so that you can set the input level. One advantage of Replay (if your Replay software is like mine) is that you can hit the LISTEN button and set the input level by ear. Listen for any distortion making its way in.

The dynamic range of the CD player may be a problem also compared to the limited dynamic range of the 8bit Replay. If you can get you hands on a clean audio compressor, it may help.

Doug

4715. HELP - loading color pictures in assembly

Newsgroup: comp.sys.atari.st
Date: 1992-05-07 07:29:19 UTC
From: bjmeier@cs.ruu.nl
Message-ID: <1992May07.072919.20470@cs.ruu.nl>
Source record: 222403

How can I load a color picture in assembly? I only have Degas Elite to draw pictures. Is it possible with Degas to make a sprite, save it as a block and load it in in assembly?

Please help,

Greeting,

Bartjan Meier (bjmeier@cs.ruu.nl)

4718. Update: HiSoft support for Lattice C v5.5

Newsgroup: comp.sys.atari.st
Date: 1992-05-07 08:35:38 UTC
From: marc@hemlock.cray.com
Message-ID: <1992May7.033538.26853@hemlock.cray.com>
Source record: 222406

Well, as promised, I spoke to someone at HiSoft. They say that they are charging money for support because they didn't make any money from it previously. Call me cynical, but it sounds like they're just trying to screw a few more quid out of us.

The guy I spoke to also said that, in the past, a lot of their time was wasted trying to debug *user* bugs, not bugs in their compiling software. He also said that they would be happy to look into real compiler problems (properly documented and researched) even if you don't fork out the dosh for Silver (or Gold) support. I thought this was fair.

So it turns out that the twenty quid is for HiSoft to fix *your own* bugs! And to the person who mailed me (sorry, I forget your name) there's no mention on the advertising bumph sent to me, nor on the product itself which says that the software is sold as-is.

Cheers,

[M][a][r][c]

4719. Info wanted on MicroProse's "Special Services"

Newsgroup: comp.sys.atari.st
Date: 1992-05-07 09:07:24 UTC
From: sigrorn@icemark.oche.de
Message-ID: <H.AdzuGzkowfA@icemark.oche.de>
Source record: 222407

Hi,

yesterday I saw the game Special Services from MicroProse at one of
our local computer dealers, but due to the fact he has no ST he couldn't
tell me that much about the game so I'm still left with some questions
on it:
What type of game is it? (I know Microprose for simulations, this looks
more like an Arcade... !??!)
Could it be installed on harddisc?
(I mean, on the packet is stated that SpecServ
- uses 3 DS-disks
- does not support harddisc
Is there any way to get them onto harddisc,
because I don't want to be my own discjockey
during play)
Is it any good? (I'm getting cautious with MicroProse since
I saw Railroad Tycoon.)

On Railroad Tycoon: Is there any way to getting this game to run stable
on a MegaSTE 4 (It states "1 meg only" and crashed when I tested it with
2.5 Meg free)?

yours,

Benedikt

-> > RAM : 1, 4 or 14 Mb, operating in page mode.

-> Do you think that this is all it will handle (ie DRAM support on
-> board and just plug SIMMs and go) or whether this is just the models that
-> Atari will come out with and that normal TT memory modules will still work
-> (ie that 32MB board from Germany will still work).

Dunno at the time. I guess they will offer SIMM supports for 1 or 4 Mb packages.
However, this is just a personal thought.

-> > DSP 56001 @ 32 MHz (?), 32 Kwords (96 Kb) of 0 wait state private RAM.
-> ^^^^^
-> Umm. Isn't a word=2 bytes....32kwords=64kbytes...or are they using
-> 3byte words for the DSP?

Yes DSP 56001 is a 24 bit DSP and uses 24 bit words.
This is very handy, since it allows the DSP to handle 16-bit samples without any loss of accuracy.

-> This is nice, but will it allow bus mastership? That would be a real
-> plus to be able to just buy an upgrade board when the 68060 comes out and you
-> want to use it instead of the old '030 (or '040 if they come with that...:).

I think so, since it is specified "DMA coprocessor". The 060 is not going to be released soon
however. Best would be a 96002 DSP.

-> > Hardware scrolling and BLITTER coprocessors.
-> I hope this will be a little more useful than the one in the Megas..:)

Well, * I think * their new customs allows for hard-sprites and all that stuff...

-> > Stereo 16 bit DMA output through a 1-bit DAC, 80 times oversampling.
-> ^^^^^^^^^
-> Doesn't this just mean that basically there is no volume control on the
-> output sound :)? All signals are 0/VCC ... no analog output? What does the over-
-> sampling do (all I know about that is its one of those buzz-words in CD ads :).

No. The 1-bit DAC is an extremely linear DAC, which is now in use on many CDs. Basically, that's true it produces only 0/Vcc levels, but those are filtered and averaged to produced a signal with less than 0.001 % distorsion.

-> > RASCAL (TM) and SDMA sound coprocessors.

These are customs. Obviously SDMA means Sound DMA.

-> Yes, but will anybody be able to use the LAN port to fit into a MAC
-> localtalk network yet?

I think so, the Zilog is the chip actually used by Apple for the localtalk net.

-> Are these like microphone jacks or head-phones jacks, as opposed to
-> RCA jacks?

Headphones jack.

-> Hmm, sounds a little inefficient to put an IDE drive in a machine with
-> an on-board SCSI-2 chip, and IDE drives are not that much cheaper than SCSI,
-> especially not enough to justify a whole IDE chipset + integration into the board.

Well, I dunno. Maybe they wanted to let all the SCSI slots free ?

-> > Lastly, retail price under $700

I agree this is rather surprising. It was on the paper. But, as always, we should see...

Atari will release this machine as *a game machine*. This explains the 1040 box. The professionnal embodiement (?) of Falcon idea will be the 040 machine.

Enjoy,

Vince.

The original release of Populous didn't work on STe's because of (you guessed
it) COPY PROTECTION. Talk about crippling software. The only reason this
came to light is when someone found that their cracked version loaded and
ran fine.

Hello Networking world,

I have the following problem:
I am having a "big" ST(2.5MB mem, 130 MB Harddisk) and a "small" one (floppy only)
just a few rooms away.
Now i am willing to connect these two computers, so the "small" one can
use the Harddisk resources of his "big" brother.
It should work from the Desktop (as am installed extra drive),
use a cheap way of connection (Midi/RS232/Centronics?), and
It`s not dead_or_alive necessary that i can work with the "big" ST while
the "small" one is accsssing files.

Does anybody know if such a thing already exists, especially if it is
Share/Freeware and/or where to get it by ftp ??

Thax in adv.

Frank

Hello all,

I was wondering if anybody out there has the game Sleeping Gods Lie? If so I have a bit of a problem with it. I bought it from a Computer store going out of bussiness, and the master disk is bad. The game seems to be put out by a company called Empire Software in Essex, but I cant seem to get a hold of them. What I would like to know is if anybody had it would you be willing to copy the master disk for me? I can mail my master disk to you for proof of purchase. Any one out there willing to help me??

John

Message-ID: <1992May7.082704.7244@uoft02.utoledo.edu>
Source record: 222414

Recently it was posted that Atari had lowered the Lynx price to
89.99 for a single unit, In the Toledo Ohio area all the stores are still
selling it for 99.99 and none of them seem to know anything about a price
reduction. One guy said it would make since, because his Lynx sales have
fallen since Sega lowered the game gear to 129.99. Any info on prices
in other areas???

IMHO Atari should lower the price to 59 or 69, there would be little
profit in the actual game unit but with the large number of Lynxes that would
sell, profits from the games would probably go up considerably.

>
>I don't think UNIX is slow. Software, is slow relative to the age of the
>computing hardware it is running on.

Well, I think you're wrong. I know how UNIX works internally, and I've seen
some of the source code for it (AT&T system V, for those who are
interested), and it's appalling.

I think there is something wrong when you have to rely on the fact that
hardware will get faster in order to run your OS at a decent speed:

"Hmm. Adding all that functionality has made things much slower"
"Yes, but if we run it on the new XYZ machine, it performs like before"
"Oh, that's all right then..."

>Workstation technology has quite a ways to go yet before it max's out itself.
>During that time you can expect UNIX performance along with X to increase
>in performance anywhere from 10-100 times during the next 5-8 years.

Again, I disagree. We're pretty close to some fundamental physical
limitations to the speed of chip technology. The performance curve is
flattening out.

>Windows hasn't even established itself as a protected mode environment yet,
>and there are still real problems with 8086 architecture and UNIX
>implementations to slow Windows technology enough to prevent your
>rapid multiplication of Windows platforms to the point of replacing X/UNIX.

8086 architecture is not the point here. Windows NT is close to being
finished (it's Beta testing right now) for MIPS R4000 and DEC Alpha platforms.
The code is designed to be portable and is not Intel specific -- Microsoft
isn't going to make that mistake.

>>>As for Windows displacing UNIX, I REALLY doubt it. Windows sucks, UNIX is

>Trust me, UNIX is fast on 68060's 586's and MIPS R4000 machines...

I use an IBM RS/6000 running IBM's bastard UNIX offspring, AIX. Yes, it's
fast, but only because the RS/6000 chip is very, very quick. It could be
sooooo much faster if AIX were better written (it could also be a damn sight
more reliable, but I'll skip over that)

>New networking technologies are also overcomming and dwarfing X's relatively
>immense hunger for network bandwidth. Improving X's performance by order of

>V--binary compatibility. Of course, a SVR4 68030 binary won't run on a
>SPARC chip, but then again, neither will a 80486 Windows binary run on any
>fast (=non Intel) workstation, even if Windows is running.

This is hard to believe, considering SunOS4.1.1 is a bsd derivative OS, while
UNIX for the ST is a SVR4 derivative. SVR4 uses ELF object files, while
BSD uses bsd/a.out format. I know SVR4 has a module to allow it to
run COFF (SVR3) binaries but not a.out.

I suppose someone could make a converter....Not.

No that will be NT.

>course, there is already such a thing: X-windows. What _might_ do well is
>an X-windows version of Windows--now _that_ would sell!

The problem is the underlying OS. Needs 32bits.

The one windowing system which no one has mentioned, and I have heard
quite a few good things about is OS2.....
It is supposed to be fasst, & runs windows and dos programs.

>How much does it cost? etc...)

The program you're probably thinking of is called X-oR (which originally stood for system eXclusive ORganizer). It is a generalized patch editor/librarian program that uses instrument "profile" files to customize the environment to the instrument. If there isn't a profile for your instrument, there are a couple of general purpose profiles available that should allow you to send and receive sysex dumps. The Atari version has a companion program called EOR, which is a graphic environment for developing instrument profiles. I've used it to write profiles for several instruments (Korg P3 and Symphony, Alesis Quadraverb GT and Quadraverb +). EOR has a bit of a learning curve associated with it, but X-oR is very powerful and takes care of all the low level functions for you, so you can concentrate on how you want to display the graphic parameters and locally organize the user interface instead of worrying about Midi data routines and graphics primitives.

There is a demo version of X-oR if you want to check it out. If you can't find it locally, you might contact Dr.T's directly:

Dr.T's Software (617)455-1454 (General Office)
124 Crescent Road (617)455-1458 (Tech Reference)
Suite 3
Needham, MA 02194

How well X-oR will suit your needs depends on how good the Midi implementation of your instrument is and how handy you are writing

profiles.

4731. Re: High Density Disk Drives

Newsgroup: comp.sys.atari.st
Date: 1992-05-07 14:44:40 UTC
From: aq115@cleveland.Freenet.Edu
Message-ID: <1992May7.144440.6019@usenet.ins.cwru.edu>
Source record: 222419

To connect a high density floppy to your Mega STE, you will need
three things:

1. An AJAX floppy controller chip. You can find these for $32 each
from ATY Computer, 3727 13th Ave, Oakland, CA, 510-482-3775

2. You will need a high density disk drive, Epson SMD-640 or SMD-300,
though I don't know who has the best price on them. On those two
drives, you can snap off the faceplate to your standard internal drive,
and pop it on the new drive. The one in your machine (for reference
only) is an SMD-380 or SMD-480.

3. TOS 2.06. You can get these from Codehead Technology, or from
Atari.

When istalling everything, be sure to turn DIP Switch 7 to ON. The
DIP switches are located in the hard drive bay near the front of the
machine.

On top of all that, you may need to remove a screw from your power supply
to keep it from channeling noise to the floppy drive. This has been known
to cause the HD installations to work unreliably.

Hope this helps.

Well 'downgrading' the TOS of a Mega STE is quite a problem.
Replacing the Rom won't work, because the Rom of an STE is in the adress-
area $e00000-$e40000, while older Tos-Versions are made for the area
$fc0000-$ff0000 .
Only the TOS 1.6 (some older 1040 STEs have it) will work in your computer
(if you're able to get it from your atari dealer).
sorry about that

The 'h' is Hidden, I think. Not sure on that one.

To get rid of those files, try going back to the desktop and
removing them, if you can. I'm not familiar with Gulam, but
you shouldn't have to reformat. You can also try ICD's Cleanup ST
or Hard Disk Toolkit, as they like to kill off filenames with
bad characters in them.

I've only just discovered the ftp site atari.archive.umich.edu and discovered that C compilers are available for down-loading. My problem is I operate from a University account. I am able to transfer files to disk in an ST disk format however I don't have hands-on access to an ST machine itself. (I'm doing this for my brother who has an STe)

So currently I have copied over sozo133i.zoo and zoo21.ttp . Not having access to an ST means I can't try out the programs before I pass on the disk. I need someone to instruct me on how to dearchive sozo133i.zoo. Is the file zoo21.ttp the one I need and do I need any other files in addition to this?

UNIX initial concept was to be small.. (Years and years ago) Take everything
out of the kernal. Look where we are now. I was Mach's (3.0) attempt to bring us
back to that stage.... (It has, the kernal size is very small. The servers
are separate standing programs (like a bsd file server, etc.) .

This may prove to be a more efficient kernal base for UNIX..

Or, just order the high density drive upgrade from Atari (or dealer) for around $140 to $160(forgot the exact number, our local dealer RUN PC got some from the Atari last week). It includes the Ajax, the drive and the TOS 2.06. (There is two version the kit, one for the Mega STe and the other for TT, the difference is the TOS chips).

4742. Ideas for an RPG 3D Dungeon

Newsgroup: comp.sys.atari.st
Date: 1992-05-07 16:23:50 UTC
From: cstdxer@warwick.ac.uk
Message-ID: <62rjbvaj@csv.warwick.ac.uk>
Source record: 222430
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Ok, does only one person out there read the news? If not is there much point in posting news when only one person can be bothered to reply?
My thanks to Stefan Schoene who actually bothered to reply!
Since I'm a generous chap and not really all that nasty I'll ask again, this time filling in a few of the details, in the sincere hope that I get a little help from fellow STers!

A friend and I are in the process of writting an RPG "type" dungeon game, along the lines of Dungeon Master. We already have a fast effective graphics engine for the maze production. The main code is being written in STOS since I can see no reason (even speed!) to resort to assembly language! The initial version (we hope) will be for 1meg only. (If we get enough response) We will then squish it down for 1/2 Meg.

We will, hopefully, release an initial PD demo, with a shareware upgrade.

Questions:

Does anyone Have ANY ideas at all about how we could improve upon Dungeon Master and It's Ilke.

Do you have any suggestions as to how much, and whether, you, joe public would be willing to pay for a reasonable game, with documentation and possibly the maze designer?

Does Any one Know anything about HBL interupts? I now have a routine which almost works. It sets up the interupts but crashes. It then recovers and allows normal operation to resume. However, a) it crashes, b) there is a seriously bad flicker on the left side, c) it judders every time the mouse is moved (we need the mouse), d) it wont work within STOS. ANY help would be very appreciated!

Stefan raised one important point in his letter to me, this is that HBL rasters wont work on a TT/Mega STE. I assume he knows what he is talking about, so is there a way around this problem?

Please Please Please do reply to this letter, the more viable ideas we get the better the game can be. Help us to make this a game worth playing not just "...another Dungeon Master clone..."!

If you do reply please could you mail me at

cstdxer@csv.warwick.ac.uk

or if you'ld rather, use Pnews to reply via the news group.

Thank you in advance,

Chris

I agree, however, that new OS that displaces traditionl UNIX might
just be NeXTStep. NeXTStep486 will be released 3rd
quarter of this year for PCs. It's currently the crown jewels on all
NeXT computers. Here we have a lean and mean Mach Version of
Unix, offering true Multi-Taskng, an excellent GUI, an ObjOriented
development environment, and Display PostScript imaging model.
After being available on PCs, plans are to transport it to
other platforms. As it becomes popular it will amass many applications,
and still retaining all the amenities that UNIX offers.

> IMHO Atari should lower the price to 59 or 69, there would be little
>profit in the actual game unit but with the large number of Lynxes that would
>sell, profits from the games would probably go up considerably.

I think the Lynx at $89.95 is a good price...

This is because many people will not buy the Lynx if the price is lowered
too much.

If you saw a football game for $5 and a football game for $25, chances are
that you will think the one that costs $25 is better.

The one for $5 may automatically be considered junk.

Also, if you are willing to pay $90 for the Lynx, you are probably willing
to dish out $$$$$ for game cards. Atari needs to attract the people who
are willing to purchas the Lynx for that price...

I use a program that converts pictures to a IMG or XIMG Format.
If you have a monocrome monitor it converts color pictures to a dither or
halftone picture.

Some formats that are supported are:
GIF, SUN, STAD, IFF, MS-Windows Bitmap ,OS/2,Gem,Gem- Metafile, Neochrome,
Art-Director, Degas, Tiny, Doodle, Spectrum 512, x Bitmap.

It's a German Shareware Program and named "GEM-View".
If you want I can send you a version by mail.
You only have to write me your address.

Roland

In a previous article, elendir@helios.enst.fr (Vincent Habchi) says:
> Atari will release this machine as *a game machine*. This explains the 1040 box. The
>professionnal embodiement (?) of Falcon idea will be the 040 machine.
>
> Enjoy,

This sounds pretty accurate to me.

I wrote Greg Pratt in November, 1991 and said that I was close to moving to
another system if Atari doesn't come out with another one in the near future.

I stated that I would like to see the Jaguar but then another computer for
a few hundred dollars more with the Jaguar capabilities. I continued to say
that Atari can then make another higher-end machine for the more "professional"
users.

He sent me a reply a week later and told me that this is what I can expect
in 1992.

Len

P.S. I then talked with him at Chicago and he confirmed it again.

ASV IS AT&T Unix System V rel 4 and as such will run ANY executable compiled
under SYSVr4 on a M680x0 system so long as the correct devices are available
(ie. you can't expect a program which accesses some Amiga specific device such
as the Agnus chip via a device driver to work on an Atari). That's what the
SYSV Applications Binary Standard was created for!

Yes, Populous II is out for the ST, but the full version (ie 1meg rather than the poxy 512K version) is out of stock. (That's what I keep on being told by the staff at the local Virgin Games store).

The 512K version only runs on STEs and has poorer graphics and little sound. (This is all according to the Box)

I asked the shop assistants if the full cersion would run on a TT (>:->) and they said yes... well I'll believe that when I see it, but Populous I almost runs on the TT, it's only when it tries to access the sound chip that it dies. The only other problem with it being that it runs too fast to play it :-(.

There's a lot of "this is better than that" stuff on word processors...so I figured i'd get in on the act! I have used Word Writer ST for a few years now...I think it's excellent...it also has a dictionary AND a thesaurus!!! The spell-check feature in WWST is great, including a personal dictionary for things that aren't in the EXTENSIVE supplied dictionary! I haven't found much use for the thesaurus though. Well, that's my 2 cents/pence/marks worth, except to state that I haven't dearchived and tried the WRITE-ON that came with STFormat yet, so I can't comment on it...but I can't see switching from my Word Writer, I guess it's what you're used to and have come to like!

>
> --Dave

You must use Binary mode and try using Kermit with CRC or
Xmodem with CRC, Sum checks is a bag of worms, this is the crap that
Amiga chaps use (or was it invented by them) on there disks and thats
why they fail a lot, the disk that is...:-) I had better put this in
as it will end up as a Atari=Amiga bigger than yours thing again..

Note: I did have a A1000, but it could
not live with me, It turned out to be Queer...:-)

Use LZH201H or later now up to 201K but not in English, but Note:
the 'K' option for some LHarc files...

Long live the A50000 , I did here that the Acorn A3000 got the
Queen's award for Technological Achievement, also with 180,000
machines sold..

Note: This is a Home RISC computer...

This is a known problem, I will post the hardware fix numbers tomorrow (the chip numbers are at home). First documented by Lars Eric Osterud on the net. You need a new DMA/shifter chip, it is the largest IC on your motherboard (80 connections instead of 64). The machines affected are later STEs and Mega STEs. If your machine is under warantee, you may be able to get Atari to fix it free. The reason is that one of Atari's custom chip suppliers did not do as good a job as the other supplier in creating this chip. The chips also have completely different part numbers, unlike past Atari practice which used to change only the last few digits in the chip number for different suppliers.

bye,

Bob Pegram

>an on-board SCSI-2 chip, and IDE drives are not that much cheaper than SCSI,
>especially not enough to justify whole IDE chipset+integration into the board.

IDE is VERY CHEAP so even Commodore put IDE in A600 (like Amiga 500
but in C64 case). IF Atari made custum chips like C= then
Atari is making Falcon and Jagaur computers CHEAPER. Jaguar
will have IDE so Atari can leave out expensive SCSI so price
will be $200-$300?

4772. Public plea to Atari was Re: Falcon specs

Newsgroup: comp.sys.atari.st
Date: 1992-05-07 20:58:17 UTC
From: ken@isgtec.com
Message-ID: <2526@isgtec.isgtec.com>
Source record: 222460

Regardless of whether Vincent Habchi's article was crap or not, I would like to make a public plea to Atari:

FOR GOD'S SAKE PUT IN 1024x768x4bit (16 colour) VIDEO!!!
(non-interlaced or interlaced). Or better yet, 1024x768x8bit (256 colour). This is standard Super-VGA type video (the 4-bit version anyway) and is widely available on PC clones at reasonable prices. It should be a separate additional mode to the others which I hope will include 640x480x8bit (256 colour), unlike the TT.

It would require a Super-VGA monitor, no problem, it would add a few hundred bucks to the price, no problem. I think for the new machine(s) to be taken seriously, they MUST have true high-res colour or they will DIE. 1024x768 is *much* different than 640x480, and opens up whole new areas of software for the machine. Any new machine in this day and age must have high-res colour.

All this stuff about 16-bit digital audio record and playback in Vincent Habchi's article is worthless if it is true. There are uses for this certainly but it should be an expansion item and should NOT be in the base machine. Damn it, there is virtually NO commercial software that uses the 8-bit DMA sound in STe's and TT's! Super audio hardware without high-res colour video would be a total waste of motherboard space. Besides, 16-bit audio requires absolutely massive amounts of hard disk, and is beyond most or all of the market for the machine. (It is certainly useless for games).

If the Falcon doesn't have high-res colour, it will be obsolete from day 1.

4773. Ghostscript 2.4.1 beta available--has color.

Newsgroup: comp.sys.atari.st
Date: 1992-05-07 23:11:26 UTC
From: timg@ncsa.uiuc.edu
Message-ID: <71802@ut-emx.uucp>
Source record: 222461

A beta version of Ghostscript 2.4.1 for the ST is available for anonymous ftp from lifshitz.ph.utexas.edu (128.83.131.57). It is in pub/ghostscript/gs241b.zoo.

The most visible change from GS 2.3.1 is the color capability of the screen driver and the addition of a color epson driver. The display of color images on the screen is rather slow, since the code is probably pretty dumb. Any suggestions for improvments are welcome. Also, I would like to know if the other drivers work OK.

I believe DEGAS blocks are something like IFF files. DEGAS screens, on
the other hand are very simple (1 word res, 16 word colour, 16000 word picture)

Wonderful, but I am sure that nobody else can read such disks, when they
are used with more than 82 tracks.
My 1040 can write only 80 tracks, my external (original Atari) SF-314 can
write 82 tracks.
So I use only 80 tracks to write on disks ...

... because I want eventually _read_ them!

If you're working on any kind of DM derivative, you SHOULD look at Ultima Underworld. Find a local PC owner and make him/her buy it so you can see it. :-) Once you see it you may rethink what you want to accomplish in your game.

>Does Any one Know anything about HBL interupts? I now have a routine which

>very appreciated!

STOS may be hosing you; in general it does a lot of horrible things. It also needs to be patched every time the OS is changed. (I'm not a big STOS fan, but I'm also biased; each to his own) I recommend using a C/assembly hybrid approach, particularly if you're going to try pushing the state of the art with your game. The 3D code will have to be well-optimized if you want the game to run smoothly. And expect to slave away for hundreds of hours on the graphics; 3D games like DM require shapes to be hand-drawn at many different sizes and angles. If you want to instead try bitmap scaling (which won't look as good), then you'll definitely need to code the Bresenham scaling algorithm in assembly. As games go you are trying to solve a relatively difficult problem.

>Stefan raised one important point in his letter to me, this is that HBL
>rasters wont work on a TT/Mega STE. I assume he knows what he is talking
>about, so is there a way around this problem?

Yes they will, actually, and if you've written them correctly there should be no code changes necessary. NEOchrome runs normally on a TT, and it does horizontal blank palette switching.

Well, it's been a while since I've asked any questions, but a few things are bugging me:

What is GEMFAST? A suburb of BELFAST?

Does Sozobon mean something in some language or is it simply the anagram for No Bozos? (It took me a while, but it finally dawned on me what ESION meant)

What are the avantages of the 2.XX TOS ROM's?

Is a hard disk unusable on a TOS 1.0 machine or does such a machine just need a lot of patches in the auto folder?

And don't forget that this won't work on some Mega STE.
This is the message I posted to the net a few weeks ago:

Subject: Problems with HD drive in a Mega STe

This is a warning to all people considering installing a HD drive
in a Mega STe: not all Mega STes are suitable for this.

The dutch company 'ATIN' sells a 'HD upgrade kit' for the Mega STe
which consists of a HD drive and an instruction leaflet. According to
the text in and on the box, it fits in all Mega STes, although
some might require a replacement disk controller. This did not work
for me, and ATIN now tells me that they have discovered recently that some
Mega STes require a more extensive modification.

The man from ATIN could tell (or at least pretended that he could tell)
that my Mega STe requires modification from the first part of the serial
number on the bottom. For my computer this is 'A1 13' (these characters are
stamped, not printed like the rest of the serial number).

According to him, the modification was too difficult to describe easily,
so he did not tell me what is was; he told me to bring my computer to
them. Since I don't want modifications like that in my computer, I did
not insist, but I am curious.

Conclusion: even for a Mega STe, changing to a HD drive might be complicated.

I get the impression that this is rare, however.

That's true of course. However, I would like to point out that the
2 MB requirement applies _only_ to the PS version, which needs memory
for font scaling. The standard version will work with 1 MB, although
more memory certainly won't do any harm.

>- Leo Hendry
>
>PS I spent a quarter of an hour going over your postings to find this mistake!

I refuse to be drawn into any form of flame war, but I have to say that if it took you 15 minutes to find a missing apostrophe / inverted letter pair in a few pages of (I must admit, not particularly carefully typed) text, then from my point of view you support my original statement that a dictionary is non-essential.

It depends... either you feel that having a large dictionary file present, which has to be either consulted from disk or loaded into RAM is worth it, because it can find a single spelling mistake which wouldn't be there if you proof-read, or you don't. I don't. Obviously you do. I think that it probably gives me more freedom to use software I like as opposed to software that must have this or that feature.

Also, as pointed out previously, dictionaries don't really offer any grammatical error checking, so you have to proof read anyway, and I think that the human eye is probably the best dictionary there is. For the odd word you can't spell, use a real dictionary. Real dictionaries don't consume any disk space whatsoever, and don't annoy you by reporting all sorts of obvious cases, such as names and places. Did your dictionary ask wether 'Ed' was misspelt? (Actually, it's 'Edd' with 2 'd''s but I can't hold that against you!)

Just my point of view. I stand by my original statement - but hey! That's what democracy and freedom of speech is all about, right?!

PS: Thanks for the good luck wish ;-)

4792. SYNTH

Newsgroup: comp.sys.atari.st
Date: 1992-05-08 13:35:33 UTC
From: vatec@sun.pcl.ac.uk
Message-ID: <1992May8.133533.24764@sun.pcl.ac.uk>
Source record: 222480

For the benefit of those who asked ...

SYNTH is a UNIX shell for the ST.
It is currently under development alongside another shell called LIBIX, which is a shell / command set / partial OS in its own right. LIBIX will be a complete self contained environment, hopefully with multitasking in the form of background processes. SYNTH is a more conventional 'shell with built in commands' shell, but quite an advanced one, and will be MiNT compatable if I can get hold of the Dlibs for MiNT.

If anyone wants details of either, I will prepare a full spec sheet file for each of them.

Neither will be relased until I decide they are ready. Both will blow your socks off. What more can I say?!

Actually, an archimedes owning friend of mine virtually had an orgasm over LIBIX when I gave him a demo of what is done so far.

Eventually LIBIX will have a full TSR UNIXlike filesystem supplied with it. This will not take place until all my bloody exams are over (for better or worse) and hopefully will be good enough for me to maybe get a job from it, degree or no degree.

4794. Re: LOGIC SIMULATION SOFTWARE

Newsgroup: comp.sys.atari.st
Date: 1992-05-08 14:03:58 UTC
From: Craig.Graham@newcastle.ac.uk
Message-ID: <1992May8.140358.6191@newcastle.ac.uk>
Source record: 222482

Thanks to all the people who've mailed me with ideas and stuff.
I'll write some doc. files and post the LOGIC SIM. to atari.archive in the next week or two. The component libraries won't be complete for a while after that, but that's just a matter of feeding in the manufacturers data sheets, so I'll just include as mush of the library as I have time to do.

P.S. I forgot to mention in my original post, but the program won't produce any hardcopy output without GDOS, and the current version is MONO only. Sorry all you colour users, but it IS compatable with MONOWARE v5 if you can put up with that.

4795. ACS, does it work with Lattice C?

Newsgroup: comp.sys.atari.st
Date: 1992-05-08 14:12:13 UTC
From: hrs@aber.ac.uk
Message-ID: <1992May8.141213.17162@aber.ac.uk>
Source record: 222483

I wonder if someone would like to summarise the features, both good and bad of the Maxon distributed 'Application Contruction System'. Is it true that it only supports Pure/Turbo C? Will there be a Lattice C version sometime? For those who don't know (and maybe I've got it wrong too) ACS is a programmers tool for making GEM programs - perhaps something akin to Visual Basic (but for C).

>Jim Howard -- deej@cadence.com | (they'd probably make me wear a tie...)

I use ELVIS under NeoDesk (which does support env. variables), but I didn't have to set any to use Elvis. Sorry, Jim, is is not an attempt to debunk you, it's really more of a statement of puzzlement! Maybe NeoDesk is somehow handling this for me? In the mean time, Jim, download Stevie and use it until you get Elvis working. I don't think Stevie is as good a vi as Elvis, but it's useable.

There are a few programs I use to take care of this problem. (ok, only 2).
This problem happened to me last night, so I have recent experience in doing
this:

Try DLII24.PRG (Something like this). Select the drive that is in question
and do a check. Then you can fix. You can also try removing the files
with this program, which seems to bypass the operating system erase and avoids
errors. If that fails you can edit that directory sector directly by placing
that funny "sigma" looking character in the first position.

OR

Try Sentry.prg. Tell it to check drive whichever and follow the directions.
The optimizer on this program is much superior and faster to that of DLII24.
I tend to trust this program more than the other, but I use both on a regular
basis, mostly in concert.

You will never be able to erase the culprit files through TOS or UIS (which
uses TOS) or any programs that goes through TOS. You will have to use one
of the above programs or similar which bypasses TOS.

These programs should be available at atari.archive.

>the 8-bit DMA sound in STe's and TT's! Super audio hardware without high-res
>colour video would be a total waste of motherboard space. Besides, 16-bit
>audio requires absolutely massive amounts of hard disk, and is beyond most
>or all of the market for the machine. (It is certainly useless for games).

I'm not sure if you've been paying attention, but Atari's been working
very hard to strengthen it's one remaining toe-hold on the US market
which is computer music. They even started a whole new music
department, which was displayed prominently at NAMM. It sounds to me
like this machine (with these oh-so-reliable specs) is a continuation of
that policy. Audio jacks, a DSP processor and 16 bit audio in the next
generation machine indicate that Atari is putting their money where
their mouth is. I was not aware that they were pursuing the video
market. Besides, I'm sure that the DSP section would be very useful in
video processing.

>If the Falcon doesn't have high-res colour, it will be obsolete from day 1.

Atari has some choices to make. If they want to have a state of the art
audio computer at a reasonable price, they had to leave some things out.
You can't please all of the people all of the time, but you damn well
better not piss off your core market. I think Atari is making the
proper choice.

4800. Mercury and Gulam Help.

Newsgroup: comp.sys.atari.st
Date: 1992-05-08 15:37:47 UTC
From: steveq@DIALix.oz.au
Message-ID: <1992May08.153747.7806@DIALix.oz.au>
Source record: 222488

Hi Gang,

Im setting up Mercury & Gulam to act as a node on Internet and automatically
pull my mail off the system.

I think I have set it up correctly, its hard to know as I dont have many
people here in Perth to help me!

However when I type login from Gulam and mercury executes Login.prg
I type in my username, then my password and then it flicks on the screen
VERY quickly File not found, and then goes back to the login: prompt!!

WHY?

WHICH FILE WASNT FOUND??

It found config.sys, and it wrote current.usr, but wont go any farther!

Any help would be very much appreciated.

Thanks

Source record: 222489

Yah, I'm sad that Sierra has dropped Atari support for new products too.

You can still get lots of good stuff from them for the ST, though only old titles. I just got Space Quest III for $19.95 on a special deal o' theirs. No Space Quest IV coming, though, or Rise of the Dragon, Nova 9, Police Quest III, etc.

Oh, as to Joerg Ballschmiter's comments:

"No, Sierra is definetely not any more converting games for the ST, as he is not very popular in the US (as you surely know), and his hardware (too few colors, itchy sound) isnt very practical for games."

I never knew the ST was a he... sorry, I sound like an ugly native English speaker here. But I have to say that there's a lot of (sadly unsupported) ST owners in the US (probably >500,000). Furthermore, though ST sound and graphics aren't up to VGA or Mac II standards, they're quite adequate (practical?!) for some really cool games. Hell, I miss some games I had on my 6502-based, 48K Atari 800, with graphics capabilities that seem stone aged now but were awesome not so long ago.

> just need a lot of patches in the auto folder?

Quite usable once you've added PINHEAD, FATSPEED & FOLDR100. I've also got a 32K cache prog that came with the drive. With those, I don't think that it's much worse, if any, than TOS 1.4 would give me.

>fact, even any oversampling giving an improvement is a questionable
>thing. I doubt anyone can hear the difference, in a lab setting. So I
>doiubt these specs are true. Why waste the time?

Please Mark, you are just plain wrong here. A 1-bit DAC with 4 times
oversampling would sound horrible. While the word "oversampling" can
be used as marketing hype, it does have a definite technical meaning
and is an extremely important technique in digital audio products.

DAC and ADC technology has many different approaches and subtle points.
For those who are just buying products and don't understand the techniques
in detail, I suggest that you pay more attention to the final results of
a given technique (effective number of bits, harmonic distortion,
signal-to-noise ratio, ...) than to amounts of oversampling. The
appropriate amount of oversampling for a given performance depends on
other signal processing in oversampling system as a whole.

I 3rd that opinion. After all, what is all of that ST-RAM space for
anyway? I hope you didn't intend it for any serious CODE? Well, maybe for
the system code...
BTW, when you program for the TT, do you have to do any special hoop-
jumping to get it to load into TT-RAM or does code load into TT-RAM by default?

> What is GemFast

It's a public domain library of low-level GEM bindings and higher-level GEM utility functions. It is distributed in source and binary form. For the Alycon, Laser/MegaMax, and Sozobon/HSC compilers, GemFast provides the low-level bindings to the ROM routines (ie, it implements the standard GEM functions such as evnt_multi() and all the rest). For other compilers, which already have builtin low-level bindings in their libraries, GemFast still provides a set of higher-level utilities to do common things that most GEM programs need done. To use GemFast with other compilers (not listed above), you need the source-code form of the libraries, so that you can compile the utilities under your compiler.

I called the library GemFast when I first wrote it, because it was so much faster than existing bindings libraries at the time. Now the focus is on high-level features rather than the raw speed of the low-level bindings (not that I've punted the speed, it's still there).

> Sozobon

Is indeed, No Bozos, spelled backwards.

> Support

If you have support-related questions about GemFast or my version of Sozobon (now HSC, v1.3x), I'd prefer it if you posted them in comp.sys.atari.st.tech -- I just scan the subject headers of messages in this newsgroup, and skip 90% of the messages here. I read most everything in .st.tech, especially if it has Sozobon, GemFast, or HSC in the subject line.

4813. Help me with UW.ARC from A.A, Please!!!

Newsgroup: comp.sys.atari.st
Date: 1992-05-08 21:11:38 UTC
From: yellowbd@eskimo.celestial.com
Message-ID: <1992May8.211138.10457@eskimo.celestial.com>
Source record: 222501

Ok, got the following files from a.a:
UW.ARC, UWBIN.ARC, uw.tar.Z

I have compiled and installed uw on my *nix system (a Sun3) and have de-arced both UW archives for the ST and installed them on my HD... Now my problem is that the program UW.PRG from UW.ARC crashes every time I try and run it...(3 bombs, I think) The WIN.PRG from the UWBIN.ARC will run, but the main window that is open doesn't have anything in it. It still shows the color of the background/desktop... I can type and it sends that to the modem, but nothing to the screen at all... I have tried it with gdos, amcgdos, and without anything, no luck... Tried changing fonts, no luck... When I try and open another window it tells me that UW protocol isn't running!

My system is a 520 STfm (1 meg upgraded), ds/dd drive, approx 170 Meg HDs with ICD Host adaptor and 5.5 ICD software, TOS 1.0 {Yeah, I know! It s--ks, but haven't been able to afford an upgrade yet...} and I'm using a Telebit T-2500 (v.32, v.42bis) modem with turbocts.prg for RTS/CTS flow control... Could my problems all stem from the fact that I only have TOS 1.0?

Any help from someone who already has this system up and working or has seen it working would be greatly appreciated! I have been doing some porting/programming on my *nix system and could really benefit from this kind of system! Thanks!

I have an ARCing/DE ARCing program called ARC Shell V2.0

If I'm not mistaken, this is either PD or Shareware.

I don't have a manual and don't have a clue as to where to start

or what to do. I have never tried to DE ARC or ARC anything before,

but have a whole lotta downloaded ARCED files on my hard drive

which I cannot get up and running.

PLEASE HELP !

Source record: 222508
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Hi,

I am trying to use Sversion() to get the TOS number from rom.

I have TOS 1.4 in my 1040 ST however I get a result returned from the function:

highbyte = $15
lowbyte = $00

According to the documentation with Laser 'C' The high byte is the version
number and the low byte is the point number.

But it is not sending me that!

Why? Any ideas? Anyone done the same thing?

I have re-written the format routine and need to know the TOS number so I can
allow for the different locations of low memory between TOS's.

Any clues would be appreciated.

Thanks,

<><>

4822. Atari - Education

Newsgroup: comp.sys.atari.st
Date: 1992-05-09 03:27:25 UTC
From: ra1cs220@troi.cc.rochester.edu
Message-ID: <1992May9.032725.18747@galileo.cc.rochester.edu>
Source record: 222509

I have a talk with the Manager of the Computing Library
and Resources Center here in UR where I work for part
time last week. It ended up that I did most of the
talking and much of them were about Atari ST!!

She told me she didn't know about the ST at all except
the old days (before nintendo came out) Atari video games.
However I told hime I own two STs and what it is, she was
really surprise and told me the possiblity of using
STs/TTs as special working startions here (like
DTP, Word Processing, Graphics etc).

now, I have talked here to bring in some Atari Magazines and
so I would like some help to lacate where I can get
free review issue of magazines to send to the CLARC,
or free subscriptions etc. I have heard of some magazines
like Atari User which are given free to dealers,
are they given to the school free also? I have seen
addresses on the net recently but I didn't gather and
would hope someone out there please forward me the
address of the publishers again. Thanks

Also, another reason I post this to the world is because
I would liek to heard from people from Germany or anyother
places where Ataris are used in high institution and
why and how is it going? Does Atari has any education plan?

I think it's long enough but i think you all understand
what I want to tell.

Just a story about what happend to me 20 hours ago. I spent
7 hours to figure out why my pascal program doesn't work
on the Mac IIsi and IIcx and found out how it went wrong
but didn't know why. Then I gave up and brought the
program back to my room and try on my Spectre GCR. Was thinking
about rewriting it but the program wan without a single
problem! The conclusion: IIsi and IIcx were 'too powerful'!

Thanks for reading.

I've been reading all this debate about Falcon and must say the specs sound great... graphics and sound are something I've been dreaming about for long time. With this kind of graphics (640*480/256 colours) you would expect to get visually pleasant and exiting new GUI. I hate current GEM windows. They are just UGLY. Take a look at Windows 3 and compare it with GEM or Windows 2! Microsoft made a correct move to include "3D style" buttons etc. This change would NOT invalidate compatibility because Atari would need only to change code in GEM which draws window components, buttons, etc.

In fact I would like to see a completely new OS with gfx/sound capabilities of the new machines utilised BUT if this is out of question then it would be time to improve GEM graphically anyway.

Hi fellow netters,

Last week I was in Sydney and to my suprise saw all these Atari
magazines on the book shelves at most book shops.

- Atari Explorer
- AtariUser (USA based version)
- ST Format
- Aim
- Your Atari (Australian)

Here in NZ we have the the UK based magazines but not the USA or
Australian based ones.

So needless to say the shop was brought out of Atari mags (grin).

I'd also like to hear about this issue (atari and edu support as I've put in for some gov grant money (probably a long shot) to equip some NY schools (Kindergarten and college) with ST/TTs but last time I called atari about their equiv of Apple/IBM/Commodore Ed support they said there was no real department for that.

BTW our mailer/readerr can't seem to reply to the individual poster--just to the group. Sorry for using the bandwidth.

If any school is interested in some projects to develop real-time conferencing (like Discourse or Aspects on the Mac/IBM) I'd like to talk to you. I have the rudiments of such a package, but with a lone ST can't really work up the Networked sections.

Gee,
I thought the MS windows were ugly and the GEM ones clean, and how about
mouse movement on MS-DOS or MAC platforms. Real jerky.

But the NeXt GUI is gorgeous. That's done correct and so fast--no need to
put those tracer lines up to fool the user into thinking updates are fast.
Just pop it in and out--the window that is.

Source record: 222518

Hello once again,

- I'm sorry if Atari doesn't plan to include 1280*960 rez, all the sheet says is 'SVGA resolution' with at least, etc... They maybe will supply a high-rez, but please recall that the Falcon 030 is a game machine and you don't need such a high rez for playing ; color is more important.
However, I won't be suprised if such a video mode is provided with the professionnal machine (040). But you will surely have to give away more bucks from your pockets.

- I didn't err writing 80 times oversampling. 1 bit-DAC is a special converter which is extremely linear but requires high sampling rates. I think that with 80 times oversampling, you get the same SNR than with a standard 16 bit DAC and 4 times oversampling, but the linearity is better. I may mistake but I hope I am not far from truth.
DSP and such audio hardware will lead to unsurpassed soundtrackers !
Have a look at a NeXT and the dmo program 'Ensemble' and you may figure out the quality it will reach.

Enjoy,

Vincent.

>
>Holy schamolies!!! That's a better system than most high-end home
>computers around!! Are they planning on marketing it in arcade cases to
>arcades ala Neo-Geo?

I heard that they plan to sell the Jaguar as a machine that costs less than
the NEO*GEO but more than the Super Nintendo...

My guess is $300...

If the Falcon '030 price info was correct, it would cost $700...

drop the keyboard, $650, drop the disk drive, $550, drop an expansion slot,
$500, drop the mouse, $450...

The price really does get lower as you keep taking stuff off that would come
with the Falcon but not with the Jaguar...

So what you have is a low-price Jaguar, a low-mid-price Falcon '030,
maybe another Falcon '030 in a PC case with 33 MHz, and a higher priced
Falcon '040...

They would certainly cover all the bases...

I also use Word Writer ST, and it is pretty good except for a few small things that really get annoying to me. First and foremost, I hate the way it handles reformatting. The fact that you have to invoke it manually is bad, but then it messes up a lot also (like combining two paragraphs together etc). Then there are little things like the fact that every time I save my work, it moves me to the beginning of the document. I then have to move back to where I was before I can continue. Also, whenever I quit the program, a dialogue box pops up telling me that I am about to lose all of my work. It doesn't check to see if I have just saved it or not. With a minor upgrade to improve things like this, Word Writer would be an excellent program. It's a pity that Timeworks will not upgrade it.

From: deej@cds8613.Cadence.COM
Message-ID: <1992May9.234232.4483@Cadence.COM>
Source record: 222524

Last week, I posted an article mentioning that I was having a problem with Llamatron consistently bombing at level 8. Well, I poked around a bit, and found out what the trouble was. I have a CAPS.ACC that gets loaded at boot time (this is a utility to tell you when the caps lock is on), and apparently llamas don't get along well with caps. As soon as I got rid of CAPS (after all, you really SHOULD be able to tell that you're typing all in caps, right?), the problem went away. Just wanted to let y'all know, in case anyone else was having similar problems.
While I have your attention, I just wanted to say thanx to all that have helped me out. I've presented a half-dozen problems that I've been having, and *consistently* get several replies with helpful advice! Thanx people, you make this group worth reading!

4838. Anyone know how to use SPECDEG?

Newsgroup: comp.sys.atari.st
Date: 1992-05-09 23:47:59 UTC
From: deej@cds8613.Cadence.COM
Message-ID: <1992May9.234759.4594@Cadence.COM>
Source record: 222525

I've downloaded misc/specdeg.lzh from atari.archive. This
utility advertises itself as a Spectrum to Degas converter. When
I lharc-extract it, I get SPECDEG.TTP. I've tried using this
every way I can think of:
SPECDEG file.spc file.pi1
SPECDEG file.spc
SPECDEG file.spc > file.pi1
...none of these seem to do anything. I'm invoking it from
the desktop (so I'm not really typing in the SPECDEG part...),
and I don't get any error messages flashing by that I can see
anyway. Does anyone have the docs for this program, or know
the right way to use it?? Thanx in advance!

There are several kits that connect the ST to the PF's parallel interface
using the PFs built-in comm program. It's also possible to use the
PF's serial interface with a null modem, however this requires new
comm software on the PF. (I have an x-modem program for it.)
So, you don't need further hardware except the serial interface module
and a null modem cable. However, it's a real problem to bring the
xmodem program onto the PF... so if you don't have access to a desktop PC
(which can exchange programs with the PF using the comm program that comes
with the parallel interface) I'd recommend buying a parallel ST<->PF-
comm kit.
It's really strange that Atari didn't put an ST version of the ft program
(that communicates to the PF using the parallel interface and the PFs
built-in comm software) onto the diskette that comes with the parallel
interface... it's a 3.5" MSDOS diskette, so it's ST readable...

> How easy are they to type on, and how long do they last, is the
> screen readable, etc, etc, etc..

The keyboard is really hard to type on. It's very uncomfortable, and
you can type only very slowly. It's not that the keys are hard to press
(the 400's keyboard is worse), the keyboard just is too small for real
typing. The display is not too bad if you have good light in the room.

You should always use a RAM card for your files, never put anything important
on the built-in ramdisk since it will be gone if the batteries fade away
(which they do within a few days if you plug the AC adaptor to the PF but
not to the AC) or if the PF crashes (on my version of the PF OS, it's enough
to create a file with "echo >filename" and then load that file into the
built-in editor (sorry: word-processor) to make the PF hang completely
(beyond reset, you have to remove the batteries to bring it back to life)).
So, RAM cards are an absolute must if you want to do anything serious
on the PF. Also, make complete backups to the ST every day since RAM cards
really aren't too reliant...

> Just a general eval would be nice. By the way, what type of text
> processing is available for it? HOw easy is it to use the built in
> text editor?

The build-in editor is not too bad if you can live with 40 columns. You
might of course use an ST program to reformat the files after download
(Micro-Emacs's "fill-paragraph" (Esc-Q) is ok for this).
Of course, it's just a simple editor, but should do for simple things.

4840. Windows 3.1 on ATSpeed

Newsgroup: comp.sys.atari.st
Date: 1992-05-10 02:06:52 UTC
From: ggreenbe@rodan.acs.syr.edu
Message-ID: <1992May9.220652.6213@newstand.syr.edu>
Source record: 222527

Well, with all the problems that Windows 3.1 has with machines
in the msdos world, I guess I'm not surprised that I cannot
get it to work on my ATSpeed. Has anybody gotten it to work?
or have any suggestions for me? Here's what happened:

I have 2.5meg in my ST, so I end up having about 1.5 extended
RAM, in addition to the 640K standard-low-memory. When I
first tried to setup Windows 3.1 via the "setup" program, I
got up to disk 4 (on 3.5" 720K disks). At this point, the
program trieds to start windows (I think) before it proceeds
with the setup...Instead of seeing Windows, however, I get a
message saying that I don't have enough extended memory to
install Windows 3.1 and that I should increase extended ram.
Then I retried the setup after deleting all tsr's, etc.,
except for HIMEM.SYS...still the same problem. The thing is,
I know I have 1.5 meg extended ram before running setup,
because that is what the msdos memory program tells me I have.
After I get the message from windows, however, the machine
crashes when I try to run "mem" to find out what is available.
So, setup is doing something to my memory.

I'd really appreciate any ideas on this!

--Gerry
ggreenbe@rodan.acs.syr.edu
PS. I'll try the windows group, too.

4841. groff-1.05 ported

Newsgroup: comp.sys.atari.st
Date: 1992-05-10 02:22:42 UTC
From: erlingh@idt.unit.no
Message-ID: <1992May10.022242.7406@ugle.unit.no>
Source record: 222528

GNU's nroff works !

I've just finnished porting groff-1.05 for atari st/tt running mint.
The diffs are available on atari.archive in the 'new' directory.
Filename: atari-groff.zoo

As with emacs18.57, I don't send binaries, as they would only work
for people with TT's anyway. Somebody else might upload an st-version ?

You will need about 3.3 Mb of free memory to compile with optimization,
and I also believe you must use gcc-2.1.

I guess this is the proof that you indeed can compile big c++ sources
with a 4-meg equipped atari :-)

I agree with you about mouse movement (jerky is an understatement) but buttons are cool. I just mentioned Windows 3 because everybody (?) have seen it. What I like more is GUI like in VAX workstations but how many of you have seen it?

>
>But the NeXt GUI is gorgeous. That's done correct and so fast--no need to

>Just pop it in and out--the window that is.
>
>robert royar

Can't comment this one... have never seen NeXt. Anyway it is just crazy not to utilise new features of a machine but stick with GUI which was designed for the machines like ST or PC (I mean PC not i386 or i486) ages ago. If new machines could run NeXt GUI - I don't have anything to complain about but black/white windows and green backgroung... yeuch! (Yes, I know there are utilities to load background pictures). It's natural that people resist change but then again I think Atari should do something to develope GEM a bit further. (Yes MultiTOS is an improvement). My original posting was intented to start a debate in this newsgroup about the way Atari should take to improve GUI. I am afraid that even though hardware becomes more powerful Atari just does nothing to improve GUI and we are using this current GEM after ten years of time.

Well, I have it running on my system without problem :

520 ST (Upgraded to 1 Meg.)
1.0 TOS (Norwegian ! (Sort of a bastard German TOS))
Mono-screen,
Double sided drive.

So I don't think that Tos 1.0 should cause you any problem.

Jarle.

The atari price for a 1 meg simm for the 1040ste is fl 349 (that's
about 100 pounds) and the normal price for a 1 meg simm is fl 100.
So the atari simms are 3.5 times as expensive as "ordinary simms"...
Are the atari simms the same as ordinary simms ? I mean 3.5 times
as expensive is a bit much even for atari.

^^^^^^^^^^^^^^^^^^^^^^^^^^^^

I don't think so. The Falcon is a HOME COMPUTER. It is said to be packaged in a 1040ST style case, but that does not make it a game machine. Really guys, do you think that Atari would waste its money on a game machine that was too expensive for theh average user?

With the recent advent of price wars betwixt Nintendo and Sega, Atari would have to be beyond stupid to release a $300 game machine. It won't sell. Look at the Neo Geo. It looks nice, but who cares? You have to morgage your home to but it!
The JAGUAR is Atari's new game machine which is supposed to be either 32 to 64 bit. Now if it is an 030 32bit machine, then I could see Atari going out of their way to make it COMPATABLE with the Falcon. It would not be a Falcon stripped down. That would be a rel stupid move.

Also for those who do not know, Atari's policy is to name game machines in development after cats(LYNX, Panther(dropped in favor of the...), Jaguar). Computers are named after birds, Falcon, Sparrow. ETC...

Also, Atari has not ANNOUNCED any of these machines. But all that has been said by Bob Brodie was that Atari's new game machine will be released UNDER $200.00. Atari has one strength, it won't release something unless they can keep it under a certain price range, ex. the CD ROM under $500 or not at all. I saw one in stores for $450.00. So it was released, just not in a big way.

I have to agree with everything you said, but I have os2 and
cant get it to run right.... It took 10 minutes (yes ** 10 **) to get
a desktop,and averaged 2 minutes to launch an app. BUT once the app was
running, it was ok. Even windows apps. But, go back to the os2 desktop,
and get a cup of coffee......??

Ziggy.

BTW, this morning os2 died, it loaded the desktop 'gray' but nothing else
besides the mouse, which did move....Grrrrrrrrrrrr.

Specdeg.ttp only convert spectre uncompress file.
So, you have to either save the spectre files in .spu or
convert the spc to spu using a program which I forgot the name
but is in atari.archive.

>I am trying to use Sversion() to get the TOS number from rom.

Sversion returns the GEMDOS version, not the TOS version. u get TOS from the OS header. so there are at least 3 pieces of the OS with versions: TOS (use OS header), GEMDOS (use Sversion), and AES (in one of the control arrays after an appl_init). 0x1500 sounds reasonable for GEMDOS under TOS 1.4 (Rainbow).

With my new 520 STe the internal drive has formatted disks up too 85 tracks, and i can read it too, but my external will not. It however will format a disk up too 84 tracks, but my internal won't read it. I have a GTS-100 as an external. Not very compatible. Point is, the new drives on the NEW computers does read/write 84+ tracks...

Oh I doubt that DOS/MSWindows is going anywhere any time soon,
I would guess 10 or more years, there are a ** LOT ** of DOS users who
will resist the change to a real OS. IF you dont belive me, look at how
long things like CPM and AppleDOS, or the C64/128 have lived......
( or how about the ST life span too..... )

Guffaw! X is big and slow because it is SO POWERFUL. That is a well known Software Engineering trade-off. Power (ie. flexibility, applicability) comes from providing Everything in Generic ways. Just as GEM is 10 times faster than X on similar hardware (TT vs. Sun 3/50). Similarly, Windows 3 on a 16MHz 386 is a DOG, especially when you don't have RAM to burn. But the point is, these days, you CAN have RAM to burn. I'm moving up to 4Meg this weekend, but that's nothing compared to workstations - 20Meg is not uncommon at all.

Warwick
ps. X is the GUI of choice for Silicon Graphics machines.

You also need to set TEMP (or TMP) to a temporary storage directory.
Preferably a RAMdisk, since an access is made for eg, every 'x' delete
operation! That's the price you pay for file safety (use a recoverable
RAMdisk) - much safer than that 'auto-save' trash. With a RAMdisk,
Elvis is VERY fast.

That's probably the SERVER program - to be run at your site!

>The WIN.PRG from the UWBIN.ARC will run,

Yes, that's the one you run on you machine.

>but the main window that is open doesn't have anything in it.

Only a cursor?

>It still shows the color of the background/desktop... I can type and
>it sends that to the modem, but nothing to the screen at all...

You must connect first! AT- commands will work, and echo (if you
have a Hayes-compat. modem).

>When I try and open another window it tells
>me that UW protocol isn't running!

That means you aren't connected to your remote host and haven't run
"uw" there. That's how UW works - you have to run a program on you
Unix box to handle the protocol.

>converter which is extremely linear but requires high sampling rates. I think
>that with 80 times oversampling, you get the same SNR than with a standard
>16 bit DAC and 4 times oversampling, but the linearity is better.

More details:

When using multi-bit parallel sampling, the sample you take to get that
16 bit sample takes a certain finite time to collect. If in that time,
the signal changes, your recording can suffer. Also, the bits of that
sample are often not actually taken SIMULTANEOUSLY (it too difficult),
so you risk incorrect results that way. With single bit sampling, you
take just one one-bit sample and send that to the DSP, then another,
then the next. Once the signal is digital rather than analog, it does
not lose accuracy, and provided the DSP power, you can reproduce the
analog signal.

At least that's how I heard it.
Warwick.

>>Jim Howard -- deej@cadence.com | (they'd probably make me wear a tie...)

>I use ELVIS under NeoDesk (which does support env. variables), but I didn't
>have to set any to use Elvis. Sorry, Jim, is is not an attempt to debunk you,
>it's really more of a statement of puzzlement! Maybe NeoDesk is somehow
>handling this for me? In the mean time, Jim, download Stevie and use it until
>you get Elvis working. I don't think Stevie is as good a vi as Elvis, but it's
>useable.

ELVIS works from every shell if the following env. variables are set:

TERM
TERMCAP (set it, if the termcap-file is _not_ found under /etc/termcap)
TMP or TEMP

That is all.

4874. Atari Computer I'd Like To See

Newsgroup: comp.sys.atari.st
Date: 1992-05-11 02:08:59 UTC
From: darling@cellar.org
Message-ID: <oT8kkB3w164w@cellar.org>
Source record: 222356

I don't know if any Atari design people read this newsgroup, but if they do, I'll bet they're having a bit of a chuckle over the various reports printed here concerning the upcoming Falcon computer. Well, I don't doubt that the machine will be a killer when it comes out. I'm sure it's well beyond the design stage. But for your amusement, my observations on what I think the damn thing needs.

I'm a professional MIDI musician. As such, the Atari ST is currently my best choice for computer music, so I own two of them. If Atari really cares about keeping its place as the premiere MIDI machine, here's what their machine should have.

(1) Multiple MIDI ins and outs, preferably 3 in and 4 out.

Right now, I use additional hardware made by C-Lab to give me the 64 MIDI channels I need; I'd like to have it an intrinsic part of the computer. With today's multitimbral synths often supporting 8 channels each, 16 channels don't cut it anymore.

(2) 16-bit digital audio ins and outs, 2 each (up to 48 KHz).

For digital audio recording. Currently, pro-quality direct-to-disk digital recording systems involve pricey external hardware. If the computer supported digital ins and outs with 16-bit DACs, all you'd need for recording/editing would be software and a decent-sized hard drive.

These DACs could serve the double duty of functioning as high-speed fax/modems. Two lines at once, in fact.

(3) 8-bit (or better) digital audio ins and outs, 1 each.

For SMPTE sync. Again, I currently use an external box from C-Lab to provide me with synchronization. Almost every MIDI musician needs sync, from multitrack recording to music-for-video. It should be included in the computer.

(4) Make graphics both standardized and optional.

I'm a musician. I have no need for 6 million colours. All I ask for is a nice crisp hi-res mono monitor (like the SM127, only higher res). If I end up paying for an ultra-high-res multi-colour video card I don't want, I'll be really pissed. The computer should support 1280 x 800 (or whatever) monochrome, with SVGA colour available as an option for those who want it.

(5) Use normal hard drives.

It always ticks me off that hard drives for my machine cost $150 more than similar units for PCs. This computer should use the same hard drives as everyone else -- IDE, SCSI, or whatever.

Naturally, the computer would be available with several possible configurations...from a 60 Meg drive for the average user, all the way up to 2-3 Gigabytes (or possibly 88 Meg removeable Syquest mechanism) for serious digital audio mastering.

(6) Use normal and/or specialty keyboards.

My Mega 2 ST keyboard is adequate, but there are plenty of PC keyboards out there I like better -- Compudyne, Keytronic, and SIIG make models ranging from $50-$100 that feel great and are easy to buy.

Alternately, I'd like the machine to support an optional "musician's keypad" -- a dedicated box with tape transport-style buttons (Stop, Play, FF, etc.) and a "scrub"-type editing wheel, available at extra cost. A dedicated programmable MIDI slider/switch box (for use as MIDI volume faders or entry of sysex parameters) would also be nice, but I guess I can make do with J.L.Cooper's external version.

...

Well, that's what I want. It's all quite possible -- cheaply, in fact -- with current technology; the only thing preventing it from being built is Atari's questionable commitment to (and knowledge of) musicians' needs.

Regarding the addition of "high res color graphics" pricing the
"Falcon" out of reach...

I just bought a SuperVGA video card (1024 x 768 with 256 colors),
including 1 Me of RAM on-board, for $79.. brand new...

So, it's not impossible for Atari to do it.. remember, this was
retail, quantity of 1... If Atari couldn't do better wholesale,
in the massive quantities everyone would like to see them produce,
they better find some new buyers...

In the past when I have had problems getting downloaded suff to run
I've discovered that either I didn't ftp it or download it in
binary mode. It's easy to miss and it will screw you every time.

Maybe that's your problem.

Eric.

4877. IBM & Mac Emulators (I'm an ST newbie)

Newsgroup: comp.sys.atari.st
Date: 1992-05-11 06:42:00 UTC
From: cpw8034@venus.tamu.edu
Message-ID: <11MAY199201422565@venus.tamu.edu>
Source record: 222359

Hey, I understand that the ST can emulate an IBM and a Mac right?
What kind of performace should I expect and where can I get one?

Are they hardware/software, hardware, of software? What's ATSpeed?
I'd appreciate any info on the subject matter. BTW, where can I get
some Atari ST magazines anymore? The only non-IBM/Mac magazine I see
any more are Amiga stuff.

Please E-Mail me as I rarely get a chance to read newsgroups! THANKS!

4878. emulators

4879. A320 Airbus by Thalion - Help with Logbook

Newsgroup: comp.sys.atari.st
Date: 1992-05-11 08:01:00 UTC
From: lezo@syma.sussex.ac.uk
Message-ID: <1992May11.080100.18065@syma.sussex.ac.uk>
Source record: 222361

I've run into a bug with A320 when doing 'Duty' flights - it
occasionally 'says' that it can not write to my logbook but then
promptly proceeds to screw the logbook up with junk (eg. 328 missions
flown !) and then freeze the computer necessitating a reboot.

Any one else had a similar problem?

Any one know the E-Mail of Thalion in Germany?

Message-ID: <705578823.1132@minster.york.ac.uk>
Source record: 222362

In response to all this hype on GUI, I feel that audio is becoming as much a part of the user interfaces as graphics. Personally I feel audio should take a higher priority because the continuity of sounds, if you are going to try and use them constructively, is more important.

Also the synchronisation of sound and picture should be taken into consideration. Hence any improvements made to the Falcon's new GUI, because of Atari's interest in Music, should follow an emphasis on the AUI (Audio User Interface!) Once of my ideas for the future is to develop an audio-graphical user environment name after myself. (Hague's Audio Graphical User Environment!) ;-)

These two senses (seeing and hearing) are extricably interlinked so why don't Atari make the first commercial move into standardising this interface with facilities to aid the interface designer and applications developer. (I know Apple have had people looking at audio in interfaces, see William Gaver's SonicFinder!)

Word Writer (and First Word Plus, which is nearly the same program!) will combine paragraphs if the last character of the paragraph is a space, rather than a full stop.

Avoid this by ensuring that you always end a paragraph with a full stop (not a solution, more of a work around).

There is another Software Engineering trade off between functionality and useability. Most UNIX vendors and the X people never seem to have considered the issue of whether continuing to add more and more functionality is a good idea, given the impact it makes.

Furthermore, if you check out the X11 sources, you'll see what I mean about efficiency.

So long as they don't make it compatible with the ST's we should be alright.

I mean, ST compatibility would be like a mill-stone around the Falcon's neck

You wanna run ST software ? Get an ST.

ST emulators on the Falcon ? Fine, could improve on the ST perhaps but
come on guys, let's have a clean break.

Please could we also have seperate main-unit and keyboard like the MEGA
range and not the whole thing together like the non-MEGA's. The keyboard
on these machines is very tacky and cumbersome.

Just putting my two penneth in.

The same here in NZ, the normal 9bit SIMMS retail for $90/150 NZ, and
from $70-90NZ trade prices..

The Atari prices are some 3-4 times more...

Its very hard to get 8bit SIMMS here, not many Mac shops left and there
prices are far to high...

I dunno if that would be especially the case. Sure, you can get a S-VGA card for peanuts these days, just like you can get a 386sx for just around $150 (board only) these days.

The problem lies in the monitor. A really good S-VGA monitor is gonna run you around $400 or more. Considering what speculations have passed about this new Falcon, thats right around half the retail price of the machine (and in my case, the same holds true, for the ST. I purchased my 520STe for $339, and want the new colour stereo monitor (forget the model), but it retails for around $300)

From: mleaver@ss10.fiveg.icl.co.uk
Message-ID: <4736@m1.cs.man.ac.uk>
Source record: 222386

First of all, has anyone got any examples of using/messing with the HBL interrupt, somebody did send me an example not so long ago, but I accidentally deleted it! :)

There's been a lot of articles posted recently about upgrading from TOS 1.0 to 1.4. I've an ancient Atari-ST (used to have 360K internal drive). How easy is it to upgrade and how much is it (in England)? Basically, do I need to do *ANY* soldering? (If so, I don't think I'll bother! :)

Thanx muchly.

```
For Sale: Atari 1040ST computer system
* 1040ST computer
2.5 megabyte ram (Z-Ram expansion board and software)
double-sided 3.5" floppy drive built in
atari mouse, 2 joysticks
* Supra Drive 40 megabyte hard disk
quantum drive, built-in clock, all the software
* Atari Color monitor
* Software
Mark Williams C compiler, assembler, shell, CSD debugger
Assempro 68000 assembler, debugger
ST-Writer word processor
Kermit, ST-Talk tele-com programs
ST language disk (Basic, etc.)
Public domain stuff-- llamatron, picture viewers, etc.
* All necessary cables, user manuals

Excellent condition-- never had a problem with any component.
Original packing materials. Hard disk and monitor 2-years old.
Original cost of this system: roughly $1900.

Asking $1000 or best offer.

I Also have a 2400-baud modem, and a panasonic 1090i printer which
I might sell or throw in with the package (each cost about $200 new).

4895. Newbie wants help w/520ST

Newsgroup: comp.sys.atari.st
Date: 1992-05-11 17:14:45 UTC
From: dud@cbnewsf.cb.att.com
Message-ID: <1992May11.171445.6952@cbfsb.cb.att.com>
Source record: 222365

Hi;

I just acquired an Atari 520ST that I think is early vintage.
It is serial number A1 1021760. I can't find a version number for
TOS, but I'd bet it's 1.0.

I have a mess o' questions about this machine, and I am posting
them because, after examining almost 700 articles in comp.sys.atari.st
and another 100+ in comp.sys.atari.st.tech, I don't see a FAQ posting
or any other info for newbies. (FAQ = Frequently Asked Questions).

0. Can anybody point me to a FAQ file or other informational files
either at ftp sites or on Compuserve, so that I can find the answers
to my questions on my own?

failing that:

1. Can I add another 512K of ram by piggy-backing chips on the existing
chips (with the chip selects bent out, etc.)? I don't see any other
way to add memory to this except to throw out the mother board, which
doesn't seem cost effective.

2. Can I replace the 360K drive with a 720K drive and use it with
the TOS I have now? It has a selection in the format program to
do double sided, so it seems possible at first blush.

3. How easy is it to add a second floppy? I don't want to buy another
overpriced drive in a little grey plastic box, if I can just daisy
chain a second drive off of the first one at the 34 pin cable.

4. How can I get software from ftp sites into this thing? The VT52
emulator doesn't seem to have file transfer capability, so how can
I bootstrap up the capability to download files? Is there a PD/Shareware
program that will allow IBM clones to write ST floppies? I can easily
get stuff into my IBM clone.

Thanks in advance, please email responses to me, and if I get requests
to, I'll mail summaries of the useful responses to those inquiring.
(Or post the summary if I get enough requests).

Hi,

i know there is a Framemaker-Version for the Mac, did anyone yet try it out `
with Spectre? How much RAM would I need for that?

Konstantin

Frame Maker has always been 99.9% reliable on Spectre (for me.....)
This includes version 2.x and 3.x

The .1% was a Frame bug in 3.0 that also occurred on a real MAC SE and II/cx.

You better have 3-4MB to comfortably run it. You can shrink the partition size for
frame to 1.5MB (at least a 2.5 MB machine?) but don't try to edit anything very large.
It comes configured for a 2MB partition.
